* Name approved by the International Union of Chemistry.

86 **Hexanedioyl chloride***. See *Adipyl chloride*.

87 **1, 2, 3, 4, 5, 6-Hexanehexol***. See *Dulcitol; Sorbitol*.

88 **Hexanenitrile***. See *Capronitrile*.

89 **1, 2, 3, 4, 5-Hexanepentol***. See *Rhamnitol*.

90 **1-Hexanethiol*** (*pri-n-hexyl mercaptan*). $CH_3(CH_2)_5SH$, 118.17. Col.liq. **D.** 0.849^{20}, **m.p.** −81.03, **b.p.** $149–50^{768}$. **Soly.** i.w.; ∞al.; ∞et.

91 **Hexanoic acid***. See *Caproic acid*.

92 **Hexanoic anhydride***. See *Caproic anhydride*.

93 **1-Hexanol*** (*n-hexyl alcohol; amylcarbinol*). $CH_3(CH_2)_4CH_2OH$, 102.11. Col.liq., *n* 1.4161^{25}. **D.** 0.8189^{20}_{4} (0.820^{20}_{4}), **m.p.** −51.6, **b.p.** 156.4. **Soly.** 0.59^{20}w.; s.al.; ∞et.

94 —, esters of organic acids. See "hexyl ester" under the names of the acids.

95 —, nitrite. See *Hexyl nitrite*.

96 —, **2-ethyl-***. $C_4H_9CH(C_2H_5)CH_2OH$, 130.14. Col.liq. **D.** 0.833^{20}_{4}, **m.p.** < −76, **b.p.** 184.6. **Soly.** 0.07^{25}w.; s.al.; s.et.

97 —, —, acetate (*β-ethylhexyl acetate*). $C_4H_9CH(C_2H_5)CH_2OOCCH_3$, 172.16. Col.liq., *n* 1.420. **D.** 0.872^{20}_{4}, **m.p.** −93, **b.p.** 199.3. **Soly.** 0.01^{43}w.

98 —, **3-isopropyl-5-methyl-*** (*isocapric alcohol; β-isoamylisoamyl alcohol; diamyl alcohol*). $(CH_3)_2CHCH(CH_2OH)(CH_2)_2CH(CH_3)_2$, 158.17. Col. oil. **D.** 0.8569^{0}_{4}, **b.p.** 211(203.3^{764}). **Soly.** i.w.; s.al.

99 —, **2-methyl-***. $CH_3(CH_2)_3CH(CH_3)CH_2OH$, 116.13. Liq. **D.** 0.831^{13}_{4}, **b.p.** $162–4^{760}$. **Soly.** i.w.; ∞al.; ∞et.

00 —, **5-methyl-*** (*isoheptyl alcohol; isohexylcarbinol*). $(CH_3)_2CH(CH_2)_3CH_2OH$, 116.12. Liq., *n* 1.4254. **D.** 0.8311^{0}_{4}; $0.825^{11.5}_{4}$, **b.p.** 167–9. **Soly.** v.sl.s.w.; s.al.; s.et.

01 **2-Hexanol*** (*butylmethylcarbinol*). $CH_3CHOH(CH_2)_3CH_3$, 102.11. Col. liq., *n* 1.4126. **D.** 0.8287^{0}_{4}; 0.80977^{20}_{4}; 0.8044^{25}_{4}, **b.p.** 140–0.4(136–9). **Soly.** v.sl.s.w.; s.al.; ∞et.

02 —, **2-methyl-*** (*butyldimethylcarbinol*). $CH_3COH(CH_3)(CH_2)_3CH_3$, 116.12. **b.p.** $58–60^{20}$.

03 —, **5-methyl-*** (*isoamylmethylcarbinol*). $CH_3CHOH(CH_2)_2CH(CH_3)_2$, 116.12. Liq. **D.** 0.8185^{17}_{4}, **b.p.** 148–50. **Soly.** i.w.; s.al.; s.et.

04 **3-Hexanol*** (*ethylpropylcarbinol*). $CH_3CH_2CHOH(CH_2)_2CH_3$, 102.11. Col.liq. **D.** 0.8188^{20}_{4}, **b.p.** 135. **Soly.** v.sl.s.w.; s.al.; ∞et.

05 —, **3-ethyl-*** (*diethylpropylcarbinol*). $CH_3CH_2COH(C_2H_5)(CH_2)_2CH_3$, 130.14. Col.liq., *n* 1.433. **D.** 0.8379^{20}_{0}, **b.p.** 160.5. **Soly.** i.w.; s.al.; s.et.

06 —, **3-ethyl-5-methyl-*** (*diethylisobutylcarbinol*). $(C_2H_5)_2COHCH_2CH(CH_3)_2$, 144.16. Liq. **D.** 0.8396^{22}_{4}, **b.p.** 172. **Soly.** i.w.; s.al.; s.et.

07 —, **3-methyl-*** (*ethylmethylpropylcarbinol*). $CH_3(CH_2)_2COH(CH_3)CH_2CH_3$, 116.12. Col.liq., *n* 1.423. **D.** 0.8234^{20}_{4}, **b.p.** 141. **Soly.** i.w.; s.al.; s.et.

08 —, **5-methyl-*** (*ethylisobutylcarbinol*). $CH_3CH_2CHOHCH_2CH(CH_3)_2$, 116.12. Liq. **b.p.** 148.2. **Soly.** i.w.; s.al.; s.et.

09 —, **2, 2, 5, 5-tetramethyl-***. $(CH_3)_3CCH_2CHOHC(CH_3)_3$, 158.17. Cr. **m.p.** 52–3, **b.p.** 173–4. **Soly.** i.w.; s.al.; s.et.

10 **2-Hexanone*** (*butyl methyl ketone*). $CH_3CO(CH_2)_3CH_3$, 100.09. Col.liq., *n* $1.39694^{17.4}$. **D.** 0.830^{0}_{4}, **m.p.** −56.9, **b.p.** 127.2. **Soly.** v.sl.s.w.; ∞al.; ∞et.

11 —, **5-methyl-*** (*isoamyl methyl ketone*). $CH_3COCH_2CH_2CH(CH_3)_2$, 114.11. Col.liq. **D.** 0.818^{17}_{4}, **b.p.** 144. **Soly.** v.sl.s.w.; ∞al.; ∞et.

12 —, **5-methyl-,** oxime. $CH_3C(:NOH)C_5H_{11}$, 129.13. Col.-yel.oil. **D.** 0.888^{20}_{4}, **b.p.** 195–6 d.

13 —, **1, 3, 4, 5, 6-pentahydroxy-***. See *Sorbose*.

14 **3-Hexanone*** (*ethyl propyl ketone*). $C_2H_5CO(CH_2)_2CH_3$, 100.09. Col.liq., *n* 1.39899^{22}. **D.** $0.813^{22.8}_{4}$, **b.p.** 124. **Soly.** v.sl.s.w.; ∞al.; ∞et.

15 —, **5-methyl-*** (*ethyl isobutyl ketone*). $C_2H_5COCH_2CH(CH_3)_2$, 114.11. Col. liq. **D.** 0.815^{17}_{0}, **b.p.** 136. **Soly.** i.w.; ∞al.; ∞et.

16 **Hexanoyl chloride***. See *Caproyl chloride*.

17 **2-Hexenal, 2-ethyl-*** (*α-ethyl-β-propylacrolein*). $CH_3(CH_2)_2CH:C(C_2H_5)CHO$, 126.11. Col.liq. **D.** 0.848^{20}_{4}, **b.p.** 175. **Soly.** i.w.; s.al.; s.et.

18 **1-Hexene*** (*butylethylene*). $CH_2:CH(CH_2)_3CH_3$, 84.09. Col.liq., *n* 1.3821. **D.** 0.6732^{20}_{4}, **m.p.** −98.5, **b.p.** 64.1. **Soly.** i.w.; ∞al.; ∞et.

19 —, **2-methyl-*** (*1-butyl-1-methylethylene*). $CH_2:C(CH_3)CH_2CH_2CH_2CH_3$, 98.11. **D.** 0.7000^{20}_{4}, **b.p.** 91.1–1.5.

For explanations and abbreviations see beginning of table.

20 1-Hexene, 3-methyl-*. CH_2:CH-CH(CH_3)$CH_2CH_2CH_3$, 98.11. **D.** 0.6953^{20}_{4}, **b.p.** 84.0.

21 —, 4-methyl-*. CH_2:CHCH_2CH-(CH_3)CH_2CH_3, 98.11. **D.** 0.6969^{20}_{4}, **b.p.** 87.2–7.5.

22 —, 5-methyl-* (*isoamylethylene*). CH_2:CHCH_2CH_2CH(CH_3)$_2$, 98.11. **D.** 0.6936^{20}_{4}, **b.p.** 84.7.

23 2-Hexene* (*β-hexylene; 1-methyl-2-propylethylene*). CH_3CH:CH(CH_2)$_2$-CH_3, 84.09. **D.** 0.6813^{20}_{4}, **b.p.** 67.9–8.1. **Soly.** s.dil.H_2SO_4.

24 —, 2-methyl-* (*1, 1-dimethyl-2-propylethylene*). (CH_3)$_2$C:CHCH_2CH_2-CH_3, 98.11. **D.** 0.7089^{20}_{4}, **b.p.** 94.4–4.6.

25 —, 3-methyl-* (*1, 2-dimethyl-1-propylethylene*). CH_3CH:C(CH_3)CH_2CH_2-CH_3, 98.11. **D.** 0.7120^{20}_{4}, **b.p.** 93.1–3.3.

26 —, 4-methyl-* (*1-sec-butyl-2-methylethylene*). CH_3CH:CHCH(CH_3)CH_2-CH_3, 98.11. (1) **D.** 0.7007^{20}_{4}, **b.p.** 87.1–7.6. (2) **D.** 0.6981^{20}_{4}, **b.p.** 85.1–5.6.

27 —, 5-methyl-* (*1-isobutyl-2-methylethylene*). CH_3CH:CHCH_2CH(CH_3)$_2$, 98.11. (1) **D.** 0.6990^{20}_{4}, **b.p.** 91.1–1.6. (2) **D.** 0.7020^{20}_{4}, **b.p.** 85.6–6.1.

28 3-Hexene* (*sym-diethylethylene; γ-hexylene*). CH_3CH_2CH:CHCH_2CH_3, 84.09. (1) **D.** 0.722^{15}_{4}, **b.p.** 67.5. (2) **D.** 0.693^{20}_{20}, **b.p.** 70–1.

29 —, 2, 5-dimethyl-* (*sym-diisopropylethylene*). (CH_3)$_2$CHCH:CHCH-(CH_3)$_2$, 112.12. **b.p.** 116–20.

30 —, 2-methyl-* (*1-ethyl-2-isopropylethylene*). (CH_3)$_2$CHCH:CHCH_2-CH_3, 98.11. **D.** 0.6942^{20}_{4}, **b.p.** 86.4–6.9.

31 2-Hexenoic acid* (*β-propylacrylic acid*). $CH_3CH_2CH_2$CH:CHCOOH, 114.08. Need.f.w., n 1.4467^{40}. **D.** 0.965^{20}_{4}, **m.p.** 32, **b.p.** 217. **Soly.** sl.s.w.; s.al.; v.s.et.

32 —, 5-methyl-* (*α, β-isoheptenic acid*). (CH_3)$_2$CHCH_2CH:CHCOOH, 128.09. n 1.4524. **D.** 0.942^{20}_{4}, **m.p.** 16.5, **b.p.** 227. **Soly.** s.al.

33 5-Hexen-3-ol, 3-ethyl-* (*allyldiethylcarbinol*). CH_2:CHCH_2COH(C_2H_5)-CH_2CH_3, 128.12. **b.p.** 156.

34 5-Hexen-2-one* (*allylacetone*). CH_2:-CH$CH_2CH_2COCH_3$, 98.08. Col.liq., n $1.42126^{15.4}$. **D.** 0.846^{20}_{4}, **b.p.** 129.5. **Soly.** i.w.; ∞al.; ∞et.

35 Hexine. See *Hexyne**.

36 *n*-Hexoic acid. See *Caproic acid.*

37 *n*-Hexoic aldehyde. See *Caproaldehyde.*

38 Hexoylene. See *2-Hexyne**.

39 Hexyl alcohol, active. See *1-Pentanol, 3-methyl-**.

40 *n*-Hexyl alcohol. See *1-Hexanol**.

41 Hexylamine*(*n*). CH_3(CH_2)$_4CH_2$-NH_2, 101.13. Col.liq. **D.** 0.763^{20}_{4}, **m.p.** −19, **b.p.** 128–30. **Soly.** v.sl.s.w.; ∞al.; ∞et.

42 *n*-Hexyl bromide. See *Hexane, 1-bromo-**.

43 *n*-Hexyl chloride. See *Hexane, 1-chloro-**.

44 Hexylene. See *Hexene**.

45 1, 6-Hexylene iodide. See *Hexane, 1, 6-diiodo-**.

Hexyl esters of organic acids. See "hexyl ester" under the names of the acids.

46 *n*-Hexyl iodide. See *Hexane, 1-iodo-**.

47 *pri-n*-Hexyl mercaptan. See *1-Hexanethiol**.

48 Hexyl nitrite(*n*). CH_3(CH_2)$_5$ONO, 131.11. Yel.liq. **D.** 0.8851^{20}_{4}, **b.p.** 129–30. **Soly.** i.w.; s.al.; s.et.

49 Hexyl sulfate (*di-n-hexyl sulfate*). [CH_3(CH_2)$_5$]$_2SO_4$, 266.26. n 1.4344^{25}. **D.** 1.0039^{25}_{25}, **b.p.** 125.3^{2}.

50 1-Hexyne* (*butylacetylene; 1-hexine*). HC:C(CH_2)$_3CH_3$, 82.08. Col.liq. **D.** 0.736^{0}_{4}; 0.7120^{20}_{4}, **m.p.** −150, **b.p.** 71.5. **Soly.** i.w.; s.al.; s.et.

51 2-Hexyne* (*2-hexine; methylpropylacetylene; hexoylene*). CH_3C:C(CH_2)$_2$-CH_3, 82.08. Liq. **D.** 0.7494^{5}; 0.7377^{15}_{4}, **b.p.** 84. **Soly.** i.w.; ∞al.; ∞et.

52 Hippuric acid (*N-benzoylglycine; benzamidoacetic acid*). C_6H_5CONHCH_2-COOH, 179.08. Col.rhomb., n 1.535, 1.592, 1.760. **D.** 1.371^{20}_{4}, **m.p.** 187.5 (189–90), **b.p.** d. **Soly.** 0.33^{20}w.; sl.s.al.; sl.s.et.; 0.11 chl.; i.bz., pet.et.

53 —, p-phenylphenacyl ester. C_6H_5-CONHCH_2COOCH_2CO$C_6H_4C_6H_5$, 373.16. **m.p.** 163.

54 *dl*-Histidine (*dl-α-amino-5-imidazolepropionic acid*). $C_3H_3N_2CH_2$CH(NH_2)-COOH, 155.09. Tetr.pr. **m.p.** 285–6 d., **b.p.** d. **Soly.** s.w.; i.al.; i.et.; i.acet., chl.

55 *d*-Histidine. $C_3H_3N_2CH_2$CH(NH_2)-COOH, 155.09. Lng.pl. **m.p.** 287–8. **Soly.** i.al.; i.et.; i.acet., chl.

* Name approved by the International Union of Chemistry.

56 ***l*-Histidine.** $C_3H_3N_2CH_2CH(NH_2)$-COOH, 155.09. Leaf.f.w. **m.p.** 277 d., **b.p.** d. 209[18]. **Soly.** s.w.; v.sl.s.al.; i.et.

57 —, diflavianate. $C_6H_9N_3O_2(C_{10}H_6N_2$-$O_8S)_2$, 783.34. Need. **m.p.** 251–2 d. **Soly.** sl.s.w.; i.al.; i.et.

58 —, dihydrochloride. $C_6H_9N_3O_2 \cdot 2HCl$, 228.02. Rhomb.pl. **m.p.** 245 d. **Soly.** v.s., d.w.; s.al.; i.et.; v.sl.s. conc.HCl.

59 **Homatropine** (*mandelyltropeine; homoatropine*). $C_{16}H_{21}NO_3$, 275.17. Deliq.pr.f.et.; glist.pr.f.al. **m.p.** 95.5–8.5. **Soly.** v.sl.s.w.; s.al.; s.et.; s. acet., dil.a., bz., chl.

60 —, hydrobromide. $C_{16}H_{21}NO_3 \cdot HBr$, 356.10. Col.rhomb.pr. **m.p.** 212 d. **Soly.** 17.5[25]w.; 3.3.al.; i.et.; s.chl.

61 —, hydrochloride. $C_{16}H_{21}NO_3 \cdot HCl$, 311.64. Sm.wh.cr., **m.p.** 216–7. **Soly.** s.w.; s.al.

62 **Homoanthranilonitrile.** See *p-Tolunitrile, 2-amino-.*

63 **Homoatropine.** See *Homatropine.*

64 **Homocinchonidine.** $C_{19}H_{22}N_2O$, 294.19. Pr. **m.p.** 207.6. **Soly.** i.w.; 4.8al.; s.chl.

65 **Homohydroquinone.** See *Toluhydroquinone.*

66 **Homophthalic acid** (*α, 2-toluenedicarboxylic acid*) $C_6H_4(CH_2COOH)$-COOH, 180.06. Cr.f.w. **m.p.** 175. **Soly.** s.h.w.; v.s.al.; sl.s.et.

67 **4-Homopyrocatechol** (*4-methylpyrocatechol*). $CH_3C_6H_3(OH)_2$, 124.06. Col., n 1.5425[74]. **D.** 1.129_4^{74}, **m.p.** 65, **b.p.** 252. **Soly.** v.s.w.; v.s.al.; v.s.et.

For explanations and abbreviations see beginning of table.

FORMULA INDEX OF ORGANIC COMPOUNDS

Numbers refer to compounds in the preceding table Physical Constants of Organic Compounds.

The arrangement of symbols in formulas is alphabetical except that C always comes first followed immediately by H if hydrogen is present. The arrangement of formulas is also alphabetical except that the number of atoms of any specific kind influences the order of compounds.

The numbers following any one formula are given in numerical order which is also the order of their occurrence in the table of physical constants.

CONSTANTS OF VEGETABLE AND ANIMAL

No.	Common name	Scientific name	Class†
1	Almond	*Prunus amygdalus*	I
2	Beef marrow	*Adeps bovis*	IX
3	Beef tallow	*Adeps bovis*	IX
4	Beechnut	*Fagus sylvatica F. Americana*	V
5	Beeswax	*Apis mellifera*	XII
6	Black mustard	*Sinapis nigra*	II
7	Bone fat	*Sevum ossis*	IX
8	Butter fat	*Vaccae lactis adeps*	IX
9	Candlenut	*Aleurites moluccana*	VI
10	Candlenut	*Aleurites triloba*	VI
11	Carnauba wax	*Corypha cerifera*	XI
12	Castor	*Ricinus communis*	III
13	Chaulmoogra	*Taraktogenos Kurzii*	V
14	Chaulmoogra	U. S. P. 10th Revision	V
15	Chinese insect wax	*Coccus cerifera*	XII
16	Chinese vegetable tallow	*Stillingia sebifera*	VIII
17	Coconut	*Cocos butyracea, C. nucifera*	VIII
18	Cocoa butter (Cacao)	*Theobroma cacao*	VIII
19	Cod liver	*Gadus morrhua*	VII
20	Corn (maize)	*Zea mais*	V
21	Cotton seed	Species *Gossypium*	V
22	Cotton seed stearin	*Gossypium*	VIII
23	Croton	*Croton tiglium*	V
24	Goose fat	*Anser cinereus*	IX
25	Grape seed	*Vites vinefera*	III
26	Hazelnut	*Corylus avellana*	I
27	Hemp seed	*Cannabus sativa*	VI
28	Horse fat	*Equus caballus*	IX
29	Human fat		IX
30	Japan wax	*Rhus succedaneum*	VIII
31	Lard oil	*Oleum adipis*	IV
32	Lard oil (fatty tissue)	*Adeps*	IX
33	Laurel (bayberry)	*Laurus nobilis*	VIII
34	Linseed	*Linum usitatissimum*	VI
35	Menhaden	*Alosa menhaden (Brevortia tyrannus)*	VII
36	Mutton tallow	*Adeps ovis*	IX
37	Myrtle wax	*Myrica cerifera (M. Carolinensis)*	VIII
38	Neat's foot	*Oleum pedis bovis*	IV
39	Nutmeg butter (mace)	*Myristica officinalis*	VIII
40	Olive	*Olea Europaea sativa*	I
41	Palm	*Elaeis guineensis*	VIII
42	Palm kernel	*Elaeis guineensis* (W. Africa)	VIII
43	Palm kernel	*Elaeis guineensis* (S. America)	VIII
44	Peach kernel	*Amygdalus Persica*	I
45	Peanut	*Arachis hypogaea*	I
46	Poppy seed	*Papaver somniferum*	VI
47	Porpoise (body oil)	*Delphinus phocaena*	VII
48	Pumpkin seed	*Cucurbita pepo*	V
49	Rabbit fat	*Lepus cuniculus*	IX
50	Rape seed	*Brassica campestris*	II
51	Safflower	*Carthamus tinctorius*	VI
52	Seal	*Species Phoca*	VII
53	Sesame	*Sesamum indicum*	V

PHYSICAL CONSTANTS OF MINERALS

The following table presents data for about 350 of the more common minerals.

In order to avoid duplication and save space, very few cross references are given in the body of the table. If the name sought is not found in the table, consult the **synonym index** given below.

Specific gravities are given at normal atmospheric temperatures, a more precise statement being valueless considering the large variations in natural minerals.

Hardness is given in terms of Mho's scale. (See under Hardness.)

Indices of refraction for the sodium line, λ = 5893 Å, unless otherwise indicated. Li, λ = 6708 Å. Indices will invariably be given in the order ω, ϵ or α, β, γ. Uniaxial crystals are considered positive if $\epsilon > \omega$, negative if $\omega > \epsilon$. Biaxial crystals are considered positive if β is nearer α in value than it is γ and negative if β is nearer γ than α.

ABBREVIATIONS

amor	amorphous	grnsh	greenish	refl	reflection
bet	between	hex	hexagonal	rhbdr	rhombohedral
bl	blue	int	internal	rhomb	rhombic
blk	black	inter	intermediate	sl	slightly

SYNONYM INDEX

Compound sought	Listed	Compound sought	Listed
Aegirite	Acmite	+Fe Bronzite	Enstatite
Alalite	Diopside	Brown hematite	Limonite
Allanite	Orthite	Calcium-chromium garnet	Uvarovite
Alum stone	Alunite	Calcspar	Calcite
Amphibole	Hornblende	Caporcianite	Laumonite
Amphigene	Leucite	Carbonado	Diamond
Antimonite	Stibnite	Carborundum, ar.if.	Moissanite
Aphthitalite	Arcanite	Carbuncle, Al-Fe' garnet	Almandite
Arsenic nickel	Niccolite	Chalybite	Siderite
Asparagus-stone	Apatite	Chessylite	Azurite
Beauxite	Bauxite	Chile saltpeter	Soda niter
Black hematite	Psilomelane	China clay	Kaolinite
Black lead	Graphite	Chlorite	Clinochlorite
Black mica	Biotite	Chrome-spinel	Picotite
Blue iron ore	Vivianite	Cobalt bloom	Erythrite
Blue malachite	Azurite	Cobalt glance	Cobaltite
Blue stone	Chalcanthite	Copper pyrites	Chalcopyrite
Blue vitriol	Chalcanthite	Copper uranite	Torbernite (R)
Bortz	Diamond		
Brimstone	Sulfur		

SYNONYM INDEX (Continued)

Compound sought	Listed	Compound sought	Listed
Copperas	Melanterite	Magnetic pyrites	Pyrrhotite
Cromfordite	Phosgenite	Malacolite	Diopside
Crysolite	Olivine	Manganblende	Alabandite
Cymophane	Chrysoberyl	Manganese-aluminum garnet	Spessartite
Dark red silver ore	Pyrargyrite	Meershaum	Sepiolite
Desmine	Stilbite	Menaccanite	Ilmenite
Dialogite	Rhodochrosite	Microcosmic salt	Stercorite
Dichroite	Cordierite	Mispickel	Arsenopyrite
Disthene	Cyanite	Molybdenum glance	Molybdenite
Dry bone	Smithsonite	Needle zeolite	Natrolite
Elaeolite	Nephelite	Nickelin	Niccolite
Emerald	Beryl	Nigrine	Rutile
Epsom salt	Epsomite	Niobite	Columbite
Erubescite	Bornite	Noumeite	Garnierite
Facellite	Kaliophilite	Octahedrite	Anatase
Fahlerz	Tetrahedrite	Peanut ore	Wolframite
Fibrolite	Sillimanite	Pearl spar	Dolomite
Flint	Chalcedony	Pencil stone agalmatolite	Pyrophyllite
Fluorapatite	Apatite	Peridot	Olivine
Fluorspar	Fluorite	Pistacite	Epidote
Fool's gold	Pyrite	Plumbago	Graphite
Fowlerite	Rhodonite	Polianite	Pyrolusite
Glance	Galena	Potassium feldspar	Orthoclase
Glaserite	Arcanite	Purple copper ore	Bornite
Glauber salt	Mirabilite	Red copper ore	Cuprite
Grammatite	Tremolite	Red zinc ore	Zincite
Gray copper ore	Tetrahedrite	Rock salt	Halite
Gray manganese ore	Manganite	Ruby	Corundum
Green carbonate of copper	Malachite	Ruby silver ore	Proustite
Green lead ore	Pyromorphite	Sapphire	Corundum
Harmotomite	Harmotome	Silver glance	Argentite
Hebronite	Amblygonite	Soapstone	Talc
Hessonite	Grossularite	Soda-microcline	Anorthoclase
Hiddenite	Spodumene	Sodium feldspar	Albite
Horn mercury	Calomel	Spathic iron	Siderite
Horn silver	Cerargyrite	Sphene	Titanite
Hyacinth	Zircon	Stassfurtite	Boracite
Hydrargillite	Gibbsite	Steatite	Talc
Hydrohematite	Turgite	Stream tin	Cassiterite
Hypersthene	Enstatite	Tabular spar	Wollastonite
Ice stone	Cryolite	Tincal	Borax
Iceland spar	Calcite	Tinstone	Cassiterite
Idocrase	Vesuvianite	Titanic iron ore	Ilmenite
Iolite	Cordierite	Troosite, var. cont. Mn	Willemite
Iron pyrites	Pyrite	Urao	Trona
Iron spinel	Hercynite	Vermilion, natural	Cinnabar
Jargon	Zircon	Websterite	Aluminite
Kunzite	Spodumene	Wernerite	Scapolite
Lapis-Lazuli	L. zurite	Wheel ore	Bournonite
Lead carbonate	Cerussite	White iron pyrites	Marcasite
Lead oxide	Litharge	White lead ore	Cerussite
Leonhardite	Laumontite	White mica	Muscovite
Lime feldspar	Anorthite	Wood tin	Cassiterite
Lime-soda feldspar	Oligoclase	Zincblende	Sphalerite
Lithiophyllite	Triphylite	Zinc-spinel	Gahnite
Lithium mica	Lepidolite	Zinc vitriol	Goslarite
Lodestone	Magnetite		
Magnesium mica	Phlogopite		

PHYSICAL CONST-

No.	Name	Synonym	Formula	Sp. gr.
1	Acmite	aegirite	$Na_2O.Fe_2O_3.4SiO_2$	3.5–3.56
2	Actinolite		$Ca(Mg, Fe)_3(SiO_3)_4$	2.9–3.2
3	Agate See *chalcedony*			
4	Alabandite	manganblende	MnS	3.95–4.04
5	Albite	sodium feldspar	$Na_2O.Al_2O_3.6SiO_2$	2.61–2.64
6	Almandite	carbuncle, Al-Fe garnet	$Al_2O_3.3FeO.3SiO_2$	3.688–4.33
7	Aluminite	websterite	$Al_2O_3.SO_3.9H_2O$	1.66
8	Alunite	alum stone	$K_2Al_6(OH)_{12}(SO_4)_4$	2.58–2.75
9	Alunogenite	alunogen	$Al_2(SO_4)_3.18H_2O$	1.6–1.8
10	Amblygonite	hebronite	$AlPO_4.LiF$	2.98–3.15
11	Analcite	analcime	$Na_2O.Al_2O_3.4SiO_2.2H_2O$	2.22–2.29
12	Anatase	octahedrite	TiO_2	3.82–3.95
13	Andalusite		Al_2SiO_5 or $Al_2O_3.SiO_2$	3.1–3.2
14	Andesine	feldspar group	$(CaO,Na_2O)Al_2O_3.4SiO_2$	2.647–2.69
15	Andradite	common garnet, black garnet	$3CaO.Fe_2O_3.3SiO_2$	3.64–3.9
16	Anglesite		$PbSO_4$	6.12–6.39
17	Anhydrite		$CaSO_4$	2.899–2.985
18	Anorthite	lime feldspar	$CaO.Al_2O_3.2SiO_2$	2.703–2.763
19	Anorthoclase	feldspar group, soda-microcline	$(Na,K)_2O.Al_2O_3.6SiO_2$	2.56–2.651
20	Anthophyllite		$(Mg,Fe)SiO_3$	2.857–3.2
21	Antigorite		$3MgO.3SiO_2.2H_2O$	2.55–2.62
22	Apatite	fluorapatite, asparagus-stone	$CaF_2.3Ca_3P_2O_8$	3.151–3.270
23	Apophyllite		$K_2O.8CaO.16SiO_2.16H_2O$	2.3–2.4
24	Aragonite		$CaCO_3$	2.85–2.94
25	Arcanite	aphthitalite, glaserite	$(K,Na)_2SO_4$	2.662
26	Argentite	silver glance	Ag_2S	7.24–7.40
27	Arsenic	native arsenic	As	5.64–5.78
28	Arsenopyrite	mispickel	$FeS_2.FeAs_2$	5.89–6.20
29	Atacamite		$3CuO.CuCl_2.3H_2O$	3.77–3.94
30	Augelite		$2Al_2O_3.P_2O_5.3H_2O$	2.77
31	Augite		$CaMg(SiO_3)_2+(Mg,Fe)(AlFe)_2SiO_6$	3.2–3.6
32	Autunite	lime uranite	$CaO.2UO_3.P_2O_5.8H_2O$	3.05–3.19
33	Axinite		$HCa_3Al_2BSi_4O_{16}$	3.22–3.314
34	Azurite	blue malachite, chessylite	$2CuCO_3.Cu(OH)_2$	3.77–3.83
35	Baddeleyite		ZrO_2	5.50–6.03
36	Barite	barytes	$BaSO_4$	4.3–4.6
37	Barysilite		$Pb_3Si_2O_7$	6.53–6.707
38	Bauxite	beauxite	$Al_2O_3.2H_2O$	2.55
39	Beccarite		$ZrO_2.SiO_2$	6.54–6.74
40	Benitoite		$BaTiSi_3O_9$	3.64–3.65
41	Bertrandite		$4BeO.2SiO_2.H_2O$	2.571–2.60
42	Beryl		$3BeO.Al_2O_3.6SiO_2$	2.63–2.91
43	Beryllonite		$NaBePO_4$	2.845
44	Biotite	black mica	$(K,H)_2(Mg,Fe)_2(Al,Fe)_2(SiO_4)_3$	2.69–3.16

PHYSICAL CONSTANTS OF

No.	Name	Synonym	Formula	Sp. gr.
1	Cotunnite		$PbCl_2$	5.84
2	Cristobalite		SiO_2	2.27–2.34
3	Crocoite	crocoisite	$PbCrO_4$	5.9–6.1
4	Cryolite	ice stone	Na_3AlF_6 or $3NaF.AlF_3$	2.95–3.00
5	Cryolithionite		$3NaF.3LiF.2AlF_3$	2.777–2.778
6	Cuprite	red copper ore	Cu_2O	5.85–6.15
7	Cyanite	disthene	Al_2SiO_5 or $Al_2O_3.SiO_2$	3.559–3.675
8	Danburite		$CaO.B_2O_3.2SiO_2$	2.93–3.02
9	Datolite		$Ca(B.OH)SiO_4$	2.89–3.00
10	Derbylite		$6FeO.Sb_2O_3.5TiO_2$	4.512–4.530
11	Diamond	bortz, carbonado	C	3.150–3.525
12	Diaspore		$Al_2O_3.H_2O$	3.3–3.5
13	Diopside	malacolite, alalite	$CaMg(SiO_3)_2$	3.20–3.38
14	Dioptasite	dioptase	$H_2O.CuO.SiO_2$	3.05–3.35
15	Dolomite	pearl spar	$CaCO_3MgCO_3$	2.80–2.99
16	Douglasite		$2KCl.FeCl_2.2H_2O$	2.16
17	Dysanalite		CaO,FeO,TiO_2, etc.	4.02–4.26
18	Eglestonite		Hg_4Cl_2O	8.327
19	Embolite		$Ag(Br,Cl)$	5.31–5.81
20	Emery	mix. of corundum, magnetite, hematite, quartz and spinel		3.75–4.31
21	Enargite		$3Cu_2S.As_2S_5$	4.43–4.55
22	Erythrite	cobalt bloom	$Co_3(AsO_4)_2.8H_2O$	2.912–2.948
23	Euclasite		$Be(AlOH)SiO_4$	3.051–3.103
24	Eudialite		$6Na_2O.6(Ca,Fe)O.20(Si,Zr)O_2.NaCl$	2.8–3.1
25	Eulytite		$3SiO_2.2Bi_2O_3$	6.106
26	Enstatite	+Fe, bronzite, hypersthene	$MgO.SiO_2$	3.10–3.43
7	Epidote	pistacite	$4CaO.3(AlFe)_2O_3.6SiO_2.H_2O$	3.07–3.50
28	Epsomite	epsom salt	$MgSO_4.7H_2O$	1.68
29	Fayalite		Fe_2SiO_4	3.91–4.34
30	Feldspars See *ortho*	*clase, microline, albite, labr*	*adorite, andesine, anorthocl*	*ase or anorthite*
31	Ferberite		$FeWO_4$	6.801–7.109
32	Fluorite	fluorspar	CaF_2	2.97–3.25
33	Forsterite		Mg_2SiO_4	3.191–3.33
34	Franklinite		$(Fe,Mn,Zn)(FeO_2)_2$	5.07–5.22
35	Gahnite	zinc-spinel	$ZnAl_2O_4$	4.478–4.602
36	Galena	galenite, glance	PbS	7.3–7.6
37	Ganomalite		$4CaO.6PbO.6SiO_2.H_2O$	5.57–5.7
38	Garnet See *alman*	*dite, andradite, grossularit*	*e, spessartite, uvarovite*	
39	Garnierite	noumeite	$H_2(Ni,Mg)SiO_4$ (variable)	2.27–2.87
40	Gay-Lussite		$CaCO_3.Na_2CO_3.5H_2O$	1.93–1.95
41	Gehlenite		$CaO.MgO.Al_2O_3.SiO_2$	2.9–3.07
42	Geikielite		$(Mg,Fe)O.TiO_2$	3.98–4.0
43	Gibbsite	hydrargillite	$Al_2O_3.3H_2O$	2.3–2.42
44	Glauberite		$Na_2SO_4.CaSO_4$	2.7–2.85
45	Glaucophane	glaucophanite	$NaAl(SiO_3)_2.(Fe,Mg)SiO_3$	2.991–3.15
46	Gold	native gold	Au	14.56–19.33

PHYSICAL CONSTANTS OF

No.	Name	Synonym	Formula	Sp. gr.
1	Goslarite	zinc vitriol	$ZnSO_4.7H_2O$	1.9–2.1
2	Göthite		$Fe_2O_3.H_2O$	4.0–4.4
3	Graphite	plumbago, black lead	C (traces of Fe, SiO_2, etc.)	2.09–2.25
4	Grossularite	hessonite	$3CaO.Al_2O_3.3SiO_2$	3.4–3.6
5	Gummite (R)		$(Pb,Ca,Ba)SiU_3O_{12}.5H_2O(?)$	3.9–5.16
6	Gypsum		$CaSO_4.2H_2O$	2.314–2.328
7	Halite	rock salt	$NaCl$	2.135–2.170
8	Hambergite		Be_2HBO_4	2.347–2.36
9	Hanksite		$9Na_2SO_4.2Na_2CO_3.KCl$	2.562
10	Harmotome	harmotomite	$(K_2,Ba)O.Al_2O_3.5SiO_2.5H_2O$	2.345–2.50
11	Hausmannite		Mn_3O_4	4.722–4.856
12	Haüynite		$5(Na_2,Ca)O.3Al_2O_3.6SiO_2.2SO_3$	2.4–2.5
13	Helvite		$3(Be,Mn,Fe)_2SiO_4.(Mn,Fe)S$	3.16–3.37
14	Hematite		Fe_2O_3	4.9–5.3
15	Hemimorphite	calamine	$2ZnO.SiO_2.H_2O$	3.45
16	Hercynite	iron spinel	$FeAl_2O_4$	3.91–3.95
17	Herderite		$CaPO_4.BeFOH$	2.952–3.012
18	Heulandite		$CaO.Al_2O_3.6SiO_2.5H_2O$	2.16–2.249
19	Hopeite		$3ZnO.P_2O_5.4H_2O$	3.03
20	Hornblende	amphibole	$Ca(Mg,Fe)_3(SiO_3)_4,Al_2(Mg,Fe)_2(AlO_3)_2(SiO_3)_2,Fe(Mg,Fe)_2(FeO_3)_2(SiO_3)_2$	3.0–3.5
21	Hübnerite		$MnO.WO_3$	7.2–7.5
22	Hutchinsonite		$(Tl,Ag,Cu)_2S.As_2S_3 + PbS.As_2S_3(?)$	4.6
23	Hydronephelite		$HNa_2Al_3Si_3O_{12}.3H_2O$	2.263–2.48
24	Hydrotalcite		$MgCO_3.5Mg(OH)_2.2Al(OH)_3.4H_2O$	2.04–2.091
25	Ilmenite	menaccanite, titanic iron ore	$FeO.TiO_2$	4.44–4.90
26	Iodyrite	iodargyrite	AgI	5.60–5.707
27	Jarosite		$K_2Fe_6(OH)_{12}.(SO_4)_4$	3.15–3.26
28	Kainite		$MgSO_4.KCl.3H_2O$	2.067–2.188
29	Kaliophilite	phacellite	$KAlSiO_4$	2.49–2.67
30	Kaolinite	china clay, kaolin	$Al_2O_3.2SiO_2.2H_2O$	2.60–2.63
31	Kieserite		$MgSO_4.H_2O$	2.57
32	Labradorite	Labrador feldspar, inter. bet. albite and anorthite	$NaAlSi_3O_8$, $CaAl_2Si_2O_8$, ratio 1:1 to 1:3	2.70–2.72
33	Lanarkite		$Pb_2O.(SO_4)$	6.3–6.8
34	Lanthanite		$La_2(CO_3)_3.9H_2O$	2.6–2.74
35	Laubanite		$Ca_2Al_2Si_5O_{15}.6H_2O$	2.23
36	Laumontite	leonhardite, caporcianite	$CaO.Al_2O_3.4SiO_2.4H_2O$	2.23–2.42
37	Laurionite		$PbCl_2.Pb(OH)_2$	6.24
38	Lazulite		$(Fe,Mg)O.Al_2O_3.P_2O_5.H_2O$	3.057–3.122
39	Lazurite	lapis-lazuli	$3Na_2O_3.3Al_2O_3.6SiO_2.2Na_2S$	2.38–2.45
40	Leadhillite		$Pb(OH)_2.PbSO_4.2PbCO_3$	6.26–6.44

PHYSICAL CONSTANTS

No.	Name	Synonym	Formula	Sp. gr.
1	Orpiment		As_2S_3	3.4–3.5
2	Orthite	allanite	$Ca_2(Al,Ce,Fe)_2(Al.OH)(SiO_4)_3$	3.0–4.2
3	Orthoclase	potassium feldspar	$K_2O.Al_2O_3.6SiO_2$	2.56
4	Parisite		$CaO.2CeOF.3CO_2$	4.320–4.42
5	Pectolite		$HNaCa_2(SiO_3)_3$	2.74–2.88
6	Penfieldite		$PbO.2PbCl_2$	
7	Penninite		$5(Mg,Fe)O.Al_2O_3.3SiO_2.4H_2O$	2.6–2.85
8	Percylite		$PbCl_2.CuO.H_2O$	4.675–4.71
9	Periclase		MgO	3.64–3.674
10	Perovskite		$CaO.TiO_2$	3.95–4.039
11	Petalite		$Li_2O.Al_2O_3.8SiO_2$	2.386–2.465
12	Pharmocosiderite		$3Fe_2O_3.2As_2O_3.13H_2O$	2.9–3.0
13	Phenacite		$2BeO.SiO_2$	2.944–3.041
14	Phlogopite	magnesium mica	$(K,H)_3Mg_3Al(SiO_4)_3$...(+Na,Fe,F)	2.737–2.869
15	Phosgenite	cromfordite	$PbCl_2,PbCO_3$	6.0–6.305
16	Picotite	chrome-spinel	$(Mg,Fe)O.(Al,Cr)_2O_3$	4.08
17	Pitchblende (R)	See *uraninite*		
18	Platinum	native platinum	Pt	13.35–19.00
19	Pleonaste	iron-magnesium spinel	$(Mg,Fe)O.Al_2O_3$	3.5–3.6
20	Pollucite		$2Cs_2O.2Al_2O_3.9SiO_2.H_2O$	2.868–2.901
21	Powellite		$CaO.MoO_3$	4.356–4.526
22	Prehnite		$2CaO.Al_2O_3.3SiO_2.H_2O$	2.80–2.95
23	Proustite	ruby silver ore	$3Ag_2S.As_2S_3$	5.51–5.64
24	Pseudobrookite		$2Fe_2O_3.3TiO_2$	4.4–4.9
25	Psilomelane	black hematite	MnO_2,BaO,H_2O,K_2O, etc.	3.7–4.7
26	Pyrargyrite	dark red silver ore	$Ag_6Sb_2S_6$	5.77–5.86
27	Pyrite	iron pyrites, fool s gold	FeS_2	4.95–5.17
28	Pyrochlorite	pyrochlore	$RNb_2O_6.R(Ti,Th)O_3$	4.2–4.36
29	Pyrochroite		$Mn(OH)_2$	3.258
30	Pyrolusite	polianite	$MnO_2(+nH_2O)$	4.73–4.86
31	Pyromorphite	green lead ore	$PbCl_2.3Pb_3(PO_4)_2$	6.50–7.12
32	Pyrophyllite	pencil stone agalmatolite	$Al_2O_3.4SiO_2.H_2O$	2.66–2.90
33	Pyrrhotite	magnetic pyrites	Fe_6S_6 to $Fe_{16}S_{17}$	4.53–4.66
34	Quartz		SiO_2	2.59–2.660
35	Raspite		$PbO.WO_3$	
36	Realgar		AsS	3.56
37	Rhodochrosite	dialogite	$MnCO_3$	3.30–3.76
38	Rhodonite	fowlerite	$MnO.SiO_2$	3.40–3.68
39	Rutile	nigrine	TiO_2	4.18–5.13
40	Sassolite		$B(OH)_3$	1.48
41	Scapolite	wernerite	$nNa_4Al_3Si_9O_{24}Cl + mCa_4Al_6Si_6O_{25}$	2.6–2.8
42	Scheelite		$CaWO_4$	5.88–6.14
43	Schorlomite		$3CaO.(Fe,Ti)_2O_3.3(Si,Ti)O_2$	3.783–3.88
44	Scolecite		$CaO.Al_2O_3.3SiO_2.3H_2O$	2.16–2.4

PHYSICAL CONSTANTS OF

No.	Name	Synonym	Formula	Sp. gr.
1	Triphylite-lithiophyllite	....	$Li(Fe,Mn)PO_4$	3.42–3.56
2	Tr gerite (R)	....	$(UO_2)_3As_2O_8.12H_2O$	3.3
3	Trona	urao	$Na_2CO_3.HNaCO_3.2H_2O$	2.11–2.147
4	Turgite	hydrohematite	$2Fe_2O_3.H_2O$	4.29–5.00
5	Turquois	....	$H_5(CuOH)[Al(OH)_2]_6(PO_4)_4$	2.60–2.89
6	Uraninite (R)	pitchblende; incl. cleveite (+Th,A,He), nivenite (+Yt), Bröggerite (+Th)	$UO_3.UO_2$,PbO, etc.	6.5–9.7
7	Uranite lime (R)	See autunite		
8	Uvarovite	calcium-chromium garnet	$3CaO.Cr_2O_3.3SiO_2$	3.418–3.81
9	Valentinite	....	Sb_2O_3	5.566
10	Vanadinite	....	$9PbO.3V_2O_5.PbCl_2$	6.7–7.2
11	Variscite	....	$AlPO_4.2H_2O$	2.47–2.54
12	Vesuvianite	idocrase	$Ca_6[Al(OH,F)]Al_2(SiO_4)_5$	3.35–3.45
13	Villiaumite	....	NaF	2.79
14	Vivianite	blue iron ore	$Fe_3(PO_4)_2.8H_2O$	2.58–2.693
15	Wagnerite	....	$Mg_3P_2O_8MgF_2$	2.985–3.14
16	Wavellite	....	$4AlPO_4.2Al(OH)_3.9H_2O$	2.316–2.356
17	Whewellite	....	$CaC_2O_4.H_2O$	2.23
18	Willemite	troosite, var. cont. Mn	Zn_2SiO_4, (+Mn)	3.89–4.19
19	Witherite	....	$BaO.CO_2$	4.28–4.35
20	Wolframite	peanut ore	$(Fe.Mn)WO_4$	7.14–7.54
21	Wollastonite	tabular spar	$CaSiO_3$	2.80–2.92
22	Wulfenite	....	$PbMoO_4$	6.7–7.0
23	Xenotime	xenotimite	$Y_2O_3.P_2O_5$	4.45–4.56
24	Zeunerite (R)	....	$Cu(UO_2)_2As_2O_8.8H_2O$	3.28
25	Zincite	red zinc ore	ZnO	5.43–5.70
26	Zircon	hyacinth, jargon	$ZrSiO_4$	4.02–4.86

PROPERTIES OF COMMERCIAL PLASTICS

Compiled by Lauchlin M. Currie—1936

Commercial Plastics

Name	Type	Manufacturer
Ameroid	TP—Casein	American Plastics Corp., 50 Union Sq., N.Y.
Bakelite	TS—Phenol Formaldehyde (Filled)	Bakelite Corp., River Road, Bound Brook, N.J.
Bakelite	TS—Phenol Formaldehyde (Pure hardened resinoid)	Bakelite Corp., River Road, Bound Brook, N.J.
Beetle	TS—Urea Formaldehyde	Beetleware Division, American Cyanamid Co., 30 Rockefeller Plaza, N.Y.
Catalin	TS—Phenol Formaldehyde	American Catalin Corp., One Park Ave., N.Y.
Celluloid	TP—Cellulose Nitrate	Celluloid Corp., 290 Ferry St., Newark, N.J.
Diakon	TP—Acrylate Resin	Imperial Chem. Industries Ltd., Millbank, London, S.W. 1
Durez	TS—Phenol Formaldehyde	General Plastics Inc., North Tonawanda, N.Y.
Fiberloid	TP—Cellulose Nitrate	Fiberloid Corp., Indian Orchard, Mass.
Fiberlon	TS—Phenol Formaldehyde	Fiberloid Corp., Indian Orchard, Mass.
Fibestos	TP—Cellulose Acetate	Fiberloid Corp., Indian Orchard, Mass.
Leukon	TP—Acrylate Resin	Imperial Chem. Industries Ltd., Millbank, London, S.W. 1
Lumarith	TP—Cellulose Acetate	Celluloid Corp., 290 Ferry St., Newark, N.J.
Perspex	TP—Acrylate Resin	Imperial Chem. Industries Ltd., Millbank, London, S.W. 1
Phenalin	TS—Phenol Formaldehyde (Cast Resin)	Du Pont Viscoloid Co., Empire State Bldg., 350 Fifth Ave., N.Y.
Plaskon	TS—Urea Formaldehyde	Plaskon Co., 2112-24 Sylvan Ave., Toledo, Ohio
Plastacele	TP—Cellulose Acetate	Du Pont Viscoloid Co., Empire State Bldg., 350 Fifth Ave., N.Y.
Plioform	TP—Rubber Derivative	Goodyear Tire and Rubber Co., Akron, Ohio
Protectoid	TP—Cellulose Acetate	Celluloid Corp., 290 Ferry St., Newark, N.J.
Pyralin	TP—Cellulose Nitrate	Du Pont Viscoloid Co., Empire State Bldg., 350 Fifth Ave., N.Y.
Resoglaz	TP—Polystyrene	Advance Solvents & Chem. Corp., 245 Fifth Ave., N.Y.
Tenite	TP—Cellulose Acetate	Tennessee Eastman Corp., Kingsport, Tenn.
Textolite	TS—Phenol Formaldehyde	General Electric Co., Plastics Dept., 920 Western Ave., W. Lynn, Mass.
Tornesit	TP—Rubber Derivative	Hercules Powder Co., Wilmington, Delaware
Trolitul	TP—Polystyrene	F. A. Hughes & Co., Ltd., Abbey House, Baker St., London, N.W. 1
Unyte	TS—Urea Formaldehyde	Unyte Corp., 521 Fifth Ave., N.Y.
Victron	TP—Polystyrene	Naugatuck Chemical Division of U. S. Rubber Products Inc., 1790 Broadway, N.Y.
Vinylite	TP—Vinyl Polymer	Carbide and Carbon Chem. Corp., 30 E. 42nd St., N.Y.

TP—thermoplastic, TS—thermosetting.

The data given in the following tables have been secured directly from the manufacturers of the plastics listed. The wide range in test values for certain tests should not be taken as indicating non-uniform materials. The data actually represent a number of different grades which, together, cover the range shown. For details regarding special grades, contacts should be made direct with the manufacturers, as shown in the preceding section.

PROPERTIES OF

	Material—Trade Name Composition	DUREZ Phenol Formaldehyde	BAKELITE Phenol Formaldehyde Filled	TEXTOLITE Phenol Formaldehyde Filled

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ

Common Name	Chemical Name	Formula
Acetic ether	Ethyl acetate	$CH_3CO_2C_2H_5$
Acid of sugar	Oxalic acid	$(CO_2H)_2$
Aldehyde	Acetaldehyde	CH_3CHO
Alum	Generally refers to potassium aluminum sulfate	$K_2Al_2(SO_4)_4 \cdot 24H_2O$
Alum flour		
Alum meal		
Alumina	Aluminum oxide	Al_2O_3
Alumino-ferric	A mixture of aluminum and sodium sulfates	....
Alundum	Fused alumina	Al_2O_3
Aniline	Phenyl amine	$C_6H_5NH_2$
Aniline salt	Aniline hydrochloride	$C_6H_5NH_2 \cdot HCl$
Antichlor	Sodium thiosulfate	$Na_2S_2O_3 \cdot 5H_2O$
Antifebrin	Acetanilide	$C_6H_5NHCOCH_3$
Antimony bloom	Antimony trioxide	Sb_2O_3
Antimony black	Antimony trisulfide	Sb_2S_3
Antimony glance		
Antimony red	Antimonous oxysulfide	$Sb_2S_3 + Sb_2O_3$
Antimony vermilion		
Antimony white	Antimonous oxide	Sb_2O_3
Antimony yellow	Basic lead antimonate	$PbO \cdot Sb_2O_5$
Aqua fortis	Nitric acid	HNO_3
Aqua regia	Nitric acid and hydrochloric acid	$HNO_3 + 3HCl$
Argol	Crude potassium acid tartrate	$KHC_4H_4O_6$
Arsenic glass	Arsenous oxide	As_2O_3
Aspirin	Acetyl-salicylic acid	$C_6H_4(CO_2H)(OCOCH_3)$
Azurite	Basic copper carbonate	$2CuCO_3 \cdot Cu(OH)_2$
Bakelite	Resin from phenol + formaldehyde	....
Baking soda	Sodium bicarbonate	$NaHCO_3$
Barium white	Barium sulfate	$BaSO_4$
Baryta	Barium oxide	BaO
Barytes	Barium sulfate (natural)	$BaSO_4$
Bauxite	Hydrated alumina	$Al_2O_3 \cdot 2H_2O$
Beet sugar	Sucrose	$C_{12}H_{22}O_{11}$
Bentonite	Impure aluminum silicate	....
Benzine	Gasoline, petrol	....
Benzol	Benzene	C_6H_6
Bichrome	Potassium dichromate	$K_2Cr_2O_7$
Bitter salt	Magnesium sulfate	$MgSO_4 \cdot 7H_2O$
Black ash	Impure sodium carbonate	....
Blanc-fixe	Barium sulfate (artificial)	$BaSO_4$
Bleaching powder	Calcium chloro-hypochlorite	$CaOCl_2$
Blende	Natural zinc sulfide	ZnS
Blue copperas		
Blue stone	Copper sulfate	$CuSO_4 \cdot 5H_2O$
Blue vitriol		
Blue salts	Nickel sulfate	$NiSO_4 \cdot 7H_2O$
Blue verditer	Basic copper carbonate	$2CuCO_3 \cdot Cu(OH)_2$
Bone ash	Impure calcium phosphate	....
Bone black	Crude animal charcoal	C
Boracic acid	Boric acid	H_3BO_3
Borax	Sodium tetraborate	$Na_2B_4O_7 \cdot 10H_2O$
Bremen blue	Basic copper carbonate	$xCuCO_3 \cdot yCu(OH)_2$
Brimstone	Sulfur	S

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ (Continued)

Common Name	Chemical Name	Formula
Burnt alum	Anhydrous potassium aluminum sulfate	$K_2Al_2(SO_4)_4$
Burnt lime	Calcium oxide	CaO
Burnt ochre Burnt ore	Ferric oxide	Fe_2O_3
"Butter of"	Refers to the chloride	
Cadmium yellow	Cadmium sulfide	CdS
Calamine	Zinc silicate	$2ZnO \cdot SiO_2 \cdot H_2O$
Calcite	Mineral calcium carbonate	$CaCO_3$
Caliche	Impure sodium nitrate	$NaNO_3$
Calomel	Mercurous chloride	$HgCl$
Camphor, artificial	Pinene hydrochloride	$C_{10}H_{17}Cl$
Cane sugar	Sucrose	$C_{12}H_{22}O_{11}$
Carbolic acid	Phenol	C_6H_5OH
Carbonic acid Carbonic anhydride	Carbon dioxide	CO_2
Carborundum	Silicon carbide	SiC
Carnallite	Magnesium potassium chloride	$MgCl_2 \cdot KCl \cdot 6H_2O$
"Caustic"	Refers to the hydroxide of a metal	
Ceruse	Basic lead carbonate	$2PbCO_3 \cdot Pb(OH)_2$
Chalk	Calcium carbonate	$CaCO_3$
Chili niter Chili saltpeter	Sodium nitrate	$NaNO_3$
China clay	Aluminum silicate	$Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$
Chinese red	Basic lead chromate	$PbCrO_4 \cdot PbO$
Chinese white	Zinc oxide	ZnO
Chloramine T	Sodium p-toluene-sulfochloramide	$(CH_3C_6H_4SO_2NCl\text{-}Na) \cdot 3H_2O$
Chloride of lime	Calcium chloro-hypochlorite	$CaOCl_2$
Chloride of soda	Sodium hypochlorite solution	$NaOCl$
Chrome alum	Potassium chromium sulfate	$K_2Cr_2(SO_4)_4 \cdot 24H_2O$
Chrome green	Chromium oxide	Cr_2O_3
Chrome red	Basic lead chromate	$PbCrO_4 \cdot PbO$
Chrome yellow	Lead chromate	$PbCrO_4$
Chromic acid	Chromium trioxide	CrO_3
Cinnabar	Mercuric sulfide	HgS
Cobalt black	Cobalt oxide	CoO
Cobalt green	Cobalt zincate	$CoZnO_2$
Common salt	Sodium chloride	$NaCl$
Copperas	Ferrous sulfate	$FeSO_4 \cdot 7H_2O$
Corn sugar	Glucose	$C_6H_{12}O_6 \cdot H_2O$
Corrosive sublimate	Mercuric chloride	$HgCl_2$
Corundum	Aluminum oxide	Al_2O_3
Cream of tartar	Potassium hydrogen tartrate	$KHC_4H_4O_6$
Cresylic acid	Mixture of *o*, *m*, and *p*-cresol	$CH_3C_6H_4OH$
Cupferron	Nitrosophenylhydroxylamine	$C_6H_5N(NO)OH$
Dekaline	Decahydronaphthalene	$C_{10}H_{18}$
Derby red	Basic lead chromate	$PbO \cdot PbCrO_4$
Derinatol	Basic bismuth gallate	$Bi(OH)_2 \cdot C_7H_5O_5$
Dextrose	Glucose	$C_6H_{12}O_6 \cdot H_2O$
Dutch liquid	Ethylene chloride	$(CH_2Cl)_2$

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ (Continued)

Common Name	Chemical Name	Formula
Eau-de-Javelle	Potassium hypochlorite solution	$KOCl$
Eau-de-Labarraque	Sodium hypochlorite solution	$NaOCl$
Emerald green	Copper aceto-arsenite	$Cu(C_2H_3O_2)_2 \cdot 3Cu\text{-}As_2O_4$
Emery powder	Impure aluminum oxide	Al_2O_3
Epsom salts	Magnesium sulfate	$MgSO_4 \cdot 7H_2O$
Essence of bitter almonds	Benzaldehyde	C_6H_5CHO
Essence of mirbane	Nitrobenzene	$C_6H_5NO_2$
Everitt's salt	Potassium ferrous ferrocyanide	$K_2Fe_2(CN)_6$
Feldspar	Potassium aluminum silicate	$K_2Si_3O_7 \cdot Al_2Si_3O_9$
Ferro prussiate	Potassium ferrocyanide	$K_4Fe(CN)_6$
Fixed white	Barium sulfate	$BaSO_4$
Flowers of sulfur	Sulfur	S
"Flowers of" a metal is a	synonym for the oxide	
Fluorspar	Calcium fluoride	CaF_2
Formalin	Forty per cent solution of formaldehyde in water	$HCHO$
Formin	Hexamethylene tetramine	$(CH_2)_6N_4$
Freezing salt	Crude sodium chloride	$NaCl$
French chalk	Hydrated silicate of magnesium	$Mg_3Si_4O_{11} \cdot H_2O$
French verdigris	Basic copper acetate	$Cu_2(C_2H_3O_2)_2(OH)_2$
Fruit sugar	Fructose	$C_6H_{12}O_6$
Fuller's earth	Hydrated magnesium and aluminum silicates	....
Fulminating mercury	Mercuric fulminate	$Hg(ONC)_2$
Fusel oil	Mixed amyl alcohols	$C_5H_{11}OH$
Gasoline	Benzine, petrol	....
Galena	Natural lead sulfide	PbS
Glauber's salt	Sodium sulfate	$Na_2SO_4 \cdot 10H_2O$
Glucose	Dextrose	$C_6H_{12}O_6 \cdot H_2O$
Glycerin	Glycerol	$C_3H_5(OH)_3$
Grain alcohol	Ethyl alcohol	C_2H_5OH
Grape sugar	Glucose	$C_6H_{12}O_6 \cdot H_2O$
Green verditer	Basic copper carbonate	$CuCO_3 \cdot Cu(OH)_2$
Green vitriol	Ferrous sulfate	$FeSO_4 \cdot 7H_2O$
Gypsum	Calcium sulfate	$CaSO_4 \cdot 2H_2O$
Hartshorn salt	Ammonium carbonate carbamate	$NH_4HCO_3 \cdot NH_4CO_2\text{-}NH_2$
Heavy spar	Barium sulfate	$BaSO_4$
Hexamine	Hexamethylene tetramine	$(CH_2)_6N_4$
Horn silver	Silver chloride	$AgCl$
Hydrosulfite	Sodium sulfite formaldehyde	$NaHSO_2 \cdot CH_2O \cdot 2H_2O$
Hypo	Sodium thiosulfate	$Na_2S_2O_3 \cdot 5H_2O$
Iron black	Precipitated antimony	Sb
Indian red	Ferric oxide	Fe_2O_3
Iron mordant	Ferric sulfate	$Fe_2(SO_4)_3$
Kainit	Double salt of potassium magnesium sulfate and magnesium chloride	$K_2Mg(SO_4)_2 \cdot MgCl_2 \cdot 6H_2O$
Kaolin	Aluminum silicate	$Al_2O_3 \cdot 2SiO_2 \cdot 2H_2O$
Kieselguhr	Siliceous earth	SiO_2
Kieserite	Mineral magnesium sulfate	$MgSO_4$
King's yellow	Arsenous sulfide	As_2S_3
Lampblack	Impure carbon	C

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ (Continued)

Common Name	Chemical Name	Formula
Lanolin	Cholesterol	$C_{27}H_{46}O$
Laughing gas	Nitrous oxide	N_2O
Lemon chrome	Barium chromate	$BaCrO_4$
Levulose	Fructose	$C_6H_{12}O_6$
Lime	Calcium oxide	CaO
Litharge	Lead monoxide	PbO
Lithopone	Zinc sulfide + barium sulfate	$ZnS + BaSO_4$
Liver of sulfur	Mixed potassium sulfides	....
Lunar caustic	Silver nitrate	$AgNO_3$
Lysol	Cresol soap solution	....
Magnesia	Magnesium oxide	MgO
Magnesite	Magnesium carbonate	$MgCO_3$
Malachite	Basic copper carbonate	$CuCO_3{\cdot}Cu(OH)_2$
Manganese black	Manganese dioxide	MnO_2
Marble	Calcium carbonate	$CaCO_3$
Marsh gas	Methane	CH_4
Massicot	Lead monoxide	PbO
Methanol	Methyl alcohol	CH_3OH
Metol	*p*-Monomethylamine-*m*-cresol sulfate or chloride	$[C_6H_3(OH)CH_3NH\text{-}CH_3]_2{\cdot}H_2SO_4$
Microcosmic salt	Sodium ammonium hydrogen phosphate	$Na(NH_4)HPO_4{\cdot}4H_2O$
Milk of barium	Barium hydroxide	$Ba(OH)_2$
Milk of lime	Calcium hydroxide	$Ca(OH)_2$
Milk of magnesium	Magnesium hydroxide	$Mg(OH)_2$
Milk of sulfur	Precipitated sulfur	S
Milk sugar	Lactose	$C_{12}H_{22}O_{11}{\cdot}H_2O$
Minium	Lead tetroxide	Pb_3O_4
Mohr's salt	Ferrous ammonium sulfate	$Fe(NH_4)_2(SO_4)_2{\cdot}6H_2O$
Molybdenite	Molybdenum disulfide	MoS_2
"Muriate of" a metal	Chloride of the metal	....
Muriatic acid	Hydrochloric acid	HCl
Naphtha (Petroleum)	A petroleum distillate	....
Naphtha (Solvent)	A coal tar distillate	....
Natron	Sodium carbonate	$Na_2CO_3{\cdot}10H_2O$
Niter	Potassium nitrate	KNO_3
Nitro-lime	Calcium cyanamide	$CaNCN$
Nitrous ether	Ethyl nitrite	C_2H_5ONO
Nordhausen acid	Fuming sulfuric acid	$H_2SO_4 + SO_3$
Oil of bitter almond	Benzaldehyde	C_6H_5CHO
Oil of garlic	Allyl sulfide	$(C_3H_5)_2S$
Oil of mirbane	Nitrobenzene	$C_6H_5NO_2$
Oil of mustard, artificial	Allyl isothiocyanate	C_3H_5NCS
Oil of pears	Amyl acetate	$CH_3CO_2C_5H_{11}$
Oil of pineapple	Ethyl butyrate	$C_3H_7CO_2C_2H_5$
Oil of vitriol	Concentrated sulfuric acid	H_2SO_4
Oil of wintergreen, artificial	Methyl salicylate	$o\text{-}HOC_6H_4CO_2CH_3$
Oleum	Fuming sulfuric acid	$H_2SO_4 + SO_3$
Olifiant gas	Ethylene	C_2H_4
Orpiment	Arsenic trisulfide	As_2S_3
Paris blue	Ferric ferrocyanide	$Fe_4[Fe(CN)_6]_3$
Paris green	Copper aceto-arsenite	$Cu(C_2H_3O_2)_2{\cdot}3CuAs_2O_4$
Pearl ash	Potassium carbonate	K_2CO_3
Permanent white	Barium sulfate	$BaSO_4$
Permutit	Artificial hydrated aluminum silicate with replaceable sodium	....

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ (Continued)

Common Name	Chemical Name	Formula
Petroleum ether	Benzine	....
Phenic acid	Phenol	C_6H_5OH
Phosgene	Carbonyl chloride	$COCl_2$
Pnosphate rock	Calcium phosphate	$Ca_3(PO_4)_2$
Picric acid	*sym*-Trinitrophenol	$C_6H_2(NO_2)_3OH$
Plaster of Paris	Calcium sulfate	$CaSO_4 \cdot \frac{1}{2}H_2O$
Plumbago	Graphite	C
Precipitated chalk	Calcium carbonate	$CaCO_3$
Prussian blue	Ferric ferrocyanide	$Fe_4[Fe(CN)_6]_3$
Prussic acid	Hydrocyanic acid	HCN
Putty powder	Impure stannic oxide	SnO_2
Pyrites	Ferrous sulfide	FeS_2
Pyroligneous acid	Crude acetic acid	CH_3CO_2H
Pyroligneous spirit	Methyl alcohol	CH_3OH
Pyrolusite	Manganese dioxide	MnO_2
Quick lime	Calcium oxide	CaO
Quicksilver	Mercury	Hg
Quinol	Hydroquinone	$C_6H_4(OH)_2(1, 4)$
Realgar	Arsenic disulfide	As_2S_2
Rectified spirit	Alcohol 90–5%	C_2H_5OH
Red antimony	Antimony oxysulfide	$Sb_2O_3 \cdot 2Sb_3S$
Red lead	Lead tetroxide	Pb_3O_4
Red liquor	Aluminum acetate solution	$Al(C_2H_3O_2)_3$
Red precipitate	Oxide of mercury	HgO
Red prussiate of potash	Potassium ferricyanide	$K_3Fe(CN)_6$
Rochelle salt	Potassium sodium tartrate	$KNaC_4H_4O_6 \cdot 4H_2O$
Rock salt	Sodium chloride	NaCl
Rouge	Ferric oxide	Fe_2O_3
Saccharin	Benzoic sulfimide	$o\text{-}C_6H_4 \cdot SO_2 \cdot NHCO$
Sal ammoniac	Ammonium chloride	NH_4Cl
Salol	Phenyl salicylate	$C_6H_4(OH)(CO_2C_6H_5)(1, 2)$
Salt	Sodium chloride	NaCl
Salt cake	Impure sodium sulfate	Na_2SO_4
Salt of amber	Succinic acid	$(CH_2CO_2H)_2$
Salt of lemon Salt of sorrel	Potassium acid oxalate	$KHC_2O_4 \cdot H_2O$
Salt of tartar Salt of wormwood	Potassium carbonate	K_2CO_3
Salt peter	Potassium nitrate	KNO_3
Salvarsan	3, 3′-Diamino-4, 4′-dihydroxy-arsenobenzene dihydrochloride	$[(HO)(NH_2)C_6H_3As]_2 \cdot 2HCl$
Satin white	Calcium sulfate	$CaSO_4 \cdot 2H_2O$
Scheele's green	Copper hydrogen arsenite	$CuHAsO_3$
Schlippe's salt	Sodium thioantimonate	$Na_3SbS_4 \cdot 9H_2O$
Silica	Silicon dioxide	SiO_2
Slaked lime	Calcium hydroxide	$Ca(OH)_2$
Soda (washing)	Sodium carbonate	$Na_2CO_3 \cdot 10H_2O$
Soda crystals	Sodium carbonate	$Na_2CO_3 \cdot 10H_2O$
Soda lime	Mixture of calcium oxide and sodium hydroxide	CaO + NaOH
Sodium hyposulfite	Sodium thiosulfate	$Na_2S_2O_3 \cdot 5H_2O$
Soft soap	Potash soap	....
Soluble glass	Sodium silicate	$Na_2SiO_3 + H_2O$
Soluble tartar	Potassium tartrate	$2K_2C_4H_4O_6 \cdot H_2O$
Spirit of hartshorn	Ammonia solution	NH_4OH
Spirit of salt	Hydrochloric acid	HCl
Spirit of wine	Ethyl alcohol	C_2H_5OH

COMMON NAMES OF CHEMICALS, THEIR CORRECT CHEMICAL NAMES AND FORMULÆ (Continued)

Common Name	Chemical Name	Formula
Stassfurtite	Magnesium borate and chloride double salt	$2Mg_3B_2O_{15}\cdot MgCl_2$
Sugar of lead	Lead acetate	$Pb(C_2H_3O_2)_2\cdot 3H_2O$
Sugar of milk	Lactose	$C_{12}H_{22}O_{11}\cdot H_2O$
Sulfuric ether	Diethyl ether	$(C_2H_5)_2O$
Superphosphate	Impure calcium acid phosphate	$CaH_4(PO_4)_2$
Sylvine	Potassium chloride	KCl
Sylvinite	Sylvine with rock salt	....
Table salt	Sodium chloride	$NaCl$
Talc	Hydrated magnesium silicate	$Mg_3Si_4O_{11}\cdot H_2O$
Tartar	Crude potassium bitartrate	$KHC_4H_4O_6$
Tartar emetic	Potassium antimonyl tartrate	$2K(SbO)C_4H_4O_6\cdot H_2O$
Tetralin	Tetrahydronaphthalene	$C_{10}H_{12}$
Tin crystals	Stannous chloride	$SnCl_2$
Tin white	Stannic hydroxide	$Sn(OH)_4$
T. N. T.	Trinitrotoluene	$C_6H_2(CH_3)(NO_2)_3$ (1, 2, 4, 6)
Toluol	Toluene	$C_6H_5CH_3$
Trona	Natural sodium carbonate	$Na_2CO_3\cdot NaHCO_3\cdot 3H_2O$
Turnbull's blue	Ferrous ferricyanide	$Fe_3[Fe(CN)_6]_2$
Ultramarine yellow	Barium chromate	$BaCrO_4$
Unslaked lime	Calcium oxide	CaO
Vanillin	Methyl ether of protocatechualdehyde	$C_6H_3(OH)(OCH_3)\text{-}CHO$(1, 2, 4)
Venetian red	Ferric oxide	Fe_2O_3
Verdigris	Basic copper acetate	$2Cu(C_2H_3O_2)_2 + CuO$(?)
Vermilion	Red mercuric sulfide	HgS
Vitriol	Sulfuric acid	H_2SO_4
"Vitriolate of"	"Sulfate of"	....
Washing soda	Sodium carbonate	$Na_2CO_3\cdot 10H_2O$
Water glass	Sodium silicates dissolved in water	....
White acid	Hydrofluoric acid and ammonium fluoride	$H_2F_2 + NH_4F$
White arsenic	Arsenous oxide	As_2O_3
White lead	Basic lead carbonate	$2PbCO_3 + Pb(OH)_2$
White vitriol	Zinc sulfate	$ZnSO_4\cdot 7H_2O$
Whiting	Calcium carbonate	$CaCO_3$
Witherite	Barium carbonate	$BaCO_3$
Wood alcohol, Wood naphtha, Wood spirit	Methyl alcohol	CH_3OH
Xylol	Xylene	$C_6H_4(CH_3)_2$
Yellow prussiate of potash	Potassium ferrocyanide	$K_4Fe(CN)_6\cdot 3H_2O$
Zinc blende	Mineral zinc sulfide	ZnS
Zinc vitriol	Zinc sulfate	$ZnSO_4\cdot 7H_2O$
Zinc white	Zinc oxide	ZnO

Pigments named in the above list refer to the pure substance and not to mixtures often sold under the same name.

TRADE NAMES OF DYESTUFF INTERMEDIATES

Trade Name	Chemical Name
A acid	1, 7-Dihydroxy-8, 6-disulfonic acid
Alizarin	1, 2-dihydroxyanthraquinone
Amino-G acid	2-Naphthylamine-6, 8-disulfonic acid
Amino-R acid	2-Naphthylamine-3, 6-disulfonic acid
Andresen's acid	1-Naphthol-3, 8-disulfonic acid
Anisidine	o-Aminophenol methyl ether
Anthrachrysone	1, 3, 5, 7-Tetrahydroxyanthraquinone
Anthraflavic acid	2, 6-Dihydroxyanthraquinone
Anthranilic acid	o-Aminobenzoic acid
Anthrarufin	1, 5-Dihydroxyanthraquinone
Armstrong's acid	Naphthalene-1, 5-disulfonic acid
Badische acid	2-Naphthylamine-8-sulfonic acid
Bayer's acid	2-Naphthol-8-sulfonic acid
Benzidine	p, p′-Diamino-diphenyl
Brönner's acid	2-Naphthylamine-6-sulfonic acid
β acid	Anthraquinone-2-sulfonic acid
Chromotrope acid	1, 8-Dihydroxynaphthalene-3, 6-disulfonic acid
Chrysazin	1, 8-Dihydroxyanthraquinone
Cleve's acids	1-Naphthylamine-6- and -7-sulfonic acids
Cleve's acid	1-Naphthylamine-5-sulfonic acid
Cleve's acid	1-Naphthylamine-6-sulfonic acid
Cleve's acid	1-Naphthylamine-3-sulfonic acid
Cleve's acid	1-Naphthylamine-7-sulfonic acid
Cresotic acids	Cresol carboxylic acids
Croceine acid	2-Naphthol-8-sulfonic acid
Dahl's acid	2-Naphthylamine-5-sulfonic acid
Dahl's acid II	1-Naphthylamine-4, 6-disulfonic acid
Dahl's acid III	1-Naphthylamine-4, 7-disulfonic acid
Disulpho acid S	1-Naphthylamine-4, 8-disulfonic acid
DTS	Dehydrothio-p-toluidine sulfonic acid
δ acid	1-Naphthol-4, 8-disulfonic acid 1-Naphthylamine-4, 8-disulfonic acid
Ebert and Merz's acid	Naphthalene-2, 7-disulfonic acid
Ebert and Merz's acid	Naphthalene-2, 6-disulfonic acid
Ewer and Pick's acid	Naphthalene-1, 6-disulfonic acid
ϵ acid	1-Naphthol-3, 8-disulfonic acid 1-Naphthylamine-3, 8-disulfonic acid
F acid	2-Naphthol-7-sulfonic acid
Freund's acid	1-Naphthylamine-3, 6-disulfonic acid
G acid	2-Naphthol-6, 8-disulfonic acid
Gallic acid	3, 4, 5-Trihydroxybenzoic acid
γ-acid	2-Amino-8-naphthol-6-sulfonic acid
H acid	1-Amino-8-naphthol-3, 6-disulfonic acid
Histazarin	2, 3-Dihydroxyanthraquinone
Isoanthraflavic acid	2, 7-Dihydroxyanthraquinone
J acid	2-Amino-5-naphthol-7-sulfonic acid
K acid	1-Amino-8-naphthol-4, 6-disulfonic acid
Kalle's acid	1-Naphthylamine-2, 7-disulfonic acid
Ketone base	Tetramethyldiaminobenzophenone
Koch's acid	1-Naphthylamine-3, 6, 8-trisulfonic acid
L acid	1-Naphthol-5-sulfonic acid
Laurent's acid	1-Naphthylamine-5-sulfonic acid
Lepidine	4-Methylquinoline
Leucotrope	Phenyldimethylbenzylammonium chloride
M acid	1-Amino-5-naphthol-7-sulfonic acid
Mesidine	2, 4, 6-Trimethylaniline
Metanilic acid	Aniline-m-sulfonic acid
Michler's ketone	Tetramethyldiaminobenzophenone
Naphthazarin	5, 6-Dihydroxy-1, 4-naphthoquinone
Naphthionic acid	1-Naphthylamine-4-sulfonic acid
o-Naphthionic	1-Naphthylamine-2-sulfonic acid
Naphthol A. S.	Anilide of -hydroxynaphthoic acid

TRADE NAMES OF DYESTUFF INTERMEDIATES
(Continued)

Trade Name	Chemical Name
Naphthoresorcin	1, 3-Dihydroxynaphthalene
Nevile and Winther's acid	1-Naphthol-4-sulfonic acid
Nigrotic acid	1, 7, 3, 6-Dihydroxysulfonaphthoic acid
Nitroso base	p-Nitrosodimethylaniline
NW acid	Nevile and Winther's acid
Peri acid	1-Naphthylamine-8-sulfonic acid
p-Phenetidine	p-Aminophenol ethyl ether
Phenyl-gamma acid	2-Phenylamino-8-naphthol-6-sulfonic acid
Phenyl Peri acid	Phenyl-1-naphthylamine-8-sulfonic acid
Phosgene	Carbonyl chloride
Phthalic acid	o-Benzenedicarboxylic acid
Picramic acid	2-Amino-4, 6-dinitrophenol
Picric acid	2, 4, 6-Trinitrophenol
Primuline base	p-Toluidine heated with sulfur.
Purpurin	1, 2, 4-Trihydroxyanthraquinone
Pyrogallol	1, 2, 3-Trihydroxybenzene
Quinaldine	2-Methylquinoline
Quinazarin	1, 4-Dihydroxyanthraquinone
R acid	2-Naphthol-3, 6-disulfonic acid
2 R acid	2-Amino-8-naphthol-3, 6-disulfonic acid
Red acid	1, 5-Dihydroxynaphthalene-3, 7-disulfonic acid
RG acid	1-Naphthol-3, 6-disulfonic acid
Resorcinol	1, 3-Dihydroxybenzene
S acid	1-Amino-8-naphthol-4-sulfonic acid
2 S acid	1-Amino-8-naphthol-2, 4-disulfonic acid
Salicylic acid	o-Hydroxybenzoic acid
Schäffer's acid	2-Naphthol-6-sulfonic acid
Schollkopf's acid	1-Naphthol-4, 8-disulfonic acid 1-Naphthylamine-4, 8-disulfonic acid 1-Naphthylamine-8-sulfonic acid
Sulfanilic acid	Aniline-p-sulfonic acid
Thiocarbanilide	Diphenylthiourea
Tobias acid	2-Naphthylamine-1-sulfonic acid
Tolidine	Di-p-aminoditolyl
Toluidine	Amino toluene
Xylidine	Amino xylene
Yellow acid	1, 3-Dihydroxynaphthalene-5, 7-disulfonic acid

THE PRONUNCIATION OF CHEMICAL WORDS

Reprinted by permission from a report of the Nomenclature, Spelling, and Pronunciation Committee of the American Chemical Society* as published in News Edition, Industrial and Engineering Chemistry, **12**, 202 (1934).

Generalizations

(1) Accenting names of chemical substances on the final syllable is to be discouraged in all cases where the preference for such an accent is not emphatic. The names *amine, arsine, quinone,* and *sulfone* and words ending in these names (also the suffix *-phenone*) represent most of the exceptions. The general trend of the accent in the English language is recognized by authorities to be away from the end and toward the beginning of the word. However, when the last syllable of a word is a significant suffix, as *-al* for aldehydes, it is not slurred by chemists.

(2) In the interest of uniformity and in accordance with a general trend of English pronunciation in America, the ending *-ide* should be pronounced *-īd.* This appears to be uniformly the practice in inorganic chemistry. Many organic names are so pronounced also. Certain organic terms, however, are pronounced *-ĭd* by many, as *acetanilide, imide, phthalimide, lipide, amide,* and several words ending in *-amide.*

(3) For chemical names ending in *-ine,* usage is divided between the pronunciations *-ēn* and *-ĭn,* with a tendency in favor of *-ēn.* Since a distinction in spelling is made by many between names of bases ending in *-ine* and names of nonbases ending in *-in,* the pronunciation *-ēn* for the ending *-ine* is to be encouraged. (It is unfortunate that this conflicts in sound with the pronunciation of the ending *-ene,* but it is believed that this will cause confusion only with a very few words, as benzine and benzene, fluorine and fluorene. As to the pronunciation *-īn,* usage, at least in America, is very strongly against it, and it would conflict with the pronunciation of the new ending *-yne* adopted for names of acetylene hydrocarbons.) Quinine, because of strong popular usage, is an exception.

(4) The pronunciation *-ōl* for the ending of names of alcohols and phenols (except the word alcohol itself!), whether regrettable or not, seems firmly fixed and should be recognized. Emphasis on a significant ending is probably an influence in this practice. Chemical terms not belonging to the above classes, but generally pronounced *-ōl,* should be spelled with a final *e*; examples, *mole, pyrrole.* This is in accordance with the recommendation of the International Committee on Organic Nomenclature. For *sol* and words ending in *-sol,* the spelling *-ol* and the pronunciation *-ŏl* should be encouraged.

(5) The ending *-yl* should be pronounced *-ĭl.* The pronunciation *-ēl* is apparently a Germanism and, although still in use

* The members of this committee are Austin M. Patterson, C. A. Jacobson, H. E. Howe, Arthur B. Lamb, E. J. Crane, *Chairman,* and the Board of Associate Editors of the *Journal of the Americal Chemical Society.*

THE PRONUNCIATION OF CHEMICAL WORDS (Continued)

to some extent, is to be discouraged. The pronunciation *-ĭl*, apparently common in England, is seldom heard in the United States.

(6) The ending *-ile* (as in nitrile). Usage is divided among the pronunciations *-īl*, *-ĭl*, and *-ēl*. The second of these is identical with the pronunciation recommended for *-yl*, and the third is apparently a Germanism. The pronunciation *-īl* should be favored.

(7) The endings *-acic*, *-alic*, *-anic*, *-aric*, *-elic*, *-enic*, *-eric*, *-etic*, *-idic*, *-ilic*, *-inic*, *-isic*, *-onic*, *-opic*, *-oric*. A rather extensive study of the pronunciation of such endings shows a preference for a *short* vowel preceding *-ic* in all but a few cases. This result is in accord with age-old general English usage and is to be approved. *Acetic* (ă-sē′tĭk) is a very emphatic exception. Other exceptions are *cetic* (sē′tĭk) and *ceric* (sē′rĭk) and adjectives derived from the names of unsaturated hydrocarbons (because of the influence of the significant *-ene* ending).

(8) The ending *-olic*. This ending is an exception to the rule for words ending in *-ic* [compare (7)], perhaps owing to the influence of words ending in *-ol*. Inasmuch as ten cases out of twelve studied favor the long *ō*, some of them by very large majorities, it is recommended that this ending be uniformly pronounced *-ō′lik*.

(9) Adjectives ending in *-ic* should be accented on the next to the last syllable, as glycer′ic, not gly′ceric. In names of salts the accent, following the trend indicated in (1) above, usually moves one syllable (occasionally more) towards the beginning of the word, as gly′cerate, sal′icylate.

(10) The ending *-ime*. In oxime, at least, this should be pronounced *-ēm*, to accord with usage, though this is contrary to the normal English trend.

(11) The ending *-oin* should be pronounced as two syllables, *-ō-ĭn*, with the accent coming on the preceding syllable (as, bĕn′zō-ĭn, fū′rō-ĭn). In certain words where the addition of a chemical suffix causes two vowels to come together there is a natural tendency to merge them and thus change their sound, as thebaine, linalool. While concession must be made to usage in particular cases, as cocaine, the pronunciation of such vowels separately is to be encouraged. The use of the dieresis is helpful, as linaloöl.

(12) Words ending in *-valent* should be so pronounced that the last two syllables are -vā′lĕnt; as trī-vā′lĕnt (not trĭv′ă-lĕnt).

The Word List

The words listed below are, except for a few deletions, the ones on which the committee's study was based. After each word there is given one or more pronunciations (shown by respelling and the use of symbols as explained at the head of

THE PRONUNCIATION OF CHEMICAL WORDS (Continued)

the list). When only a single pronunciation is shown this means that usage and perhaps other influences are so strongly in favor of it that no alternative is proposed. When more than one pronunciation is shown an attempt has been made to place these in the order of preference. The provision of two, occasionally three, pronunciations indicates that usage is divided without a marked show of preference (this is true of many words throughout the English language), or that there is some conflict between usage and the other influences properly taken into consideration. The word "usage" in parentheses following a pronunciation signifies that usage supports it to a considerable extent, notwithstanding other dictates.

Again let it be said that there is no attempt to proclaim "This pronunciation is right and this one is wrong." Usage, chemical nomenclature considerations, derivation, and the rules of good English (a compromise has sometimes been necessary) suggest certain preferences and these we have tried to ascertain.

Key to Pronunciation

The symbols used in the respelling for pronunciation have the following values: āle, senâte, ăm, ăccount, ärm; ēve, ēvent, ĕnd, recĕnt, makẽr; īce, ĭll; ōld, ōbey, ôrb, ŏdd, cŏnnect; ūse, ūnite, ûrn, ŭp, circŭs; fōōd; oil; chair; go; thin.

abietic	ăb′ĭ-ĕt′ĭk

CdS.</td></tr>
</table>

QUALITATIVE ANALYSIS SCHEME (Continued)

Analysis of the Tin-Group

Precipitate from Sodium Sulfide Solution: S, HgS, As_2S_5, Sb_2S_5, SnS_2. Heat with 12 n. HCl.			
Residue: S, HgS, As_2S_5. Add NH_4OH.		Solution: $SbCl_3$, H_2SnCl_6. Dilute, heat, pass in H_2S.	
Residue: S, HgS. Add HCl and $KClO_3$.	Solution. Evaporate, add HNO_3, then NH_4OH	Orange precipitate: Sb_2S_3. Dissolve in HCl, add Sn.	Solution: H_2SnCl_6. Partly neutralize, pass in H_2S
Solution: $HgCl_2$. Add $SnCl_2$.	Solution: $(NH_4)_3AsO_4$. Add $Mg(NO_3)_2$.	Black deposit: Sb. Add NaOBr.	Precipitate: SnS_2. Evaporate without filtering.
Precipitate: Hg_2Cl_2 or Hg.	Precipitate: $MgNH_4AsO_4$. Add $AgNO_3$.	Black deposit: Sb.	Solution: H_2SnCl_6. Boil with Sb.
	Red residue: Ag_3AsO_4.		Solution: $SnCl_2$. Add $HgCl_2$.
			Precipitate: Hg_2Cl_2.

Separation of the Aluminum and Iron Groups

Filtrate from the Hydrogen Sulfide Precipitate. Add NH_4OH in excess.		
Precipitate *: $Al(OH)_3$, $Cr(OH)_3$, $Fe(OH)_{2-3}$: $Mn(OH)_3$ after exposure to air. Solution: Salts of $Zn(NH_3)_4$, $Ni(NH_3)_4$, Co, Mn, Ba, Sr, Ca, Mg, K, and Na. Add $(NH_4)_2S$ and filter.		
Precipitate *: $Al(OH)_3$, $Cr(OH)_3$, FeS, ZnS, MnS, CoS, NiS. Dissolve in HCl and $KClO_3$, add NaOH.		Filtrate: Alkaline-Earth and Alkali Groups.
Precipitate *: $Fe(OH)_3$, $Mn(OH)_2$, $Co(OH)_2$, $Ni(OH)_2$. Solution: $NaAlO_2$, $NaCrO_2$, Na_2ZnO_2. Add Na_2O_2 and filter.		
Filtrate: Aluminum-Group. $NaAlO_2$, Na_2ZnO_2, Na_2CrO_4.	Precipitate *: Iron-Group. $MnO(OH)_2$, $Fe(OH)_3$, $Co(OH)_3$, $Ni(OH)_2$.	

* When phosphate is present in the solution, these precipitates may contain the phosphates of the elements otherwise precipitated as hydroxides, and also the phosphates of barium, strontium, calcium, and magnesium.

QUALITATIVE ANALYSIS SCHEME (Continued)

Analysis of the Aluminum-Group

<table>
<tr><td colspan="3">Filtrate from the Sodium Hydroxide and Peroxide Treatment: $NaAlO_2$, Na_2ZnO_2, Na_2CrO_4. Acidify with HCl, add NH_4OH.</td></tr>
<tr><td>Precipitate: $Al(OH)_3$. Dissolve in HNO_3, add $Co(NO_3)_2$, evaporate, ignite.</td><td colspan="2">Filtrate: $Zn(NH_3)_4Cl_2$, Na_2CrO_4. Add Na_2CO_3, boil to expel NH_3.</td></tr>
<tr><td rowspan="2">Blue residue: $Co(AlO_2)_2$.</td><td>Precipitate: $ZnCO_3xZn(OH)_2$. Dissolve in HCl, add NH_4OH and $(NH_4)_2S$.</td><td>Filtrate: Na_2CrO_4. Add HAc and $PbAc_2$.</td></tr>
<tr><td>White precipitate: ZnS.</td><td>Yellow precipitate: $PbCrO_4$.</td></tr>
</table>

Analysis of the Iron-Group

<table>
<tr><td colspan="4">Precipitate Produced by Sodium Hydroxide and Peroxide:
A. Phosphate absent: $MnO(OH)_2$, $Fe(OH)_3$,* $Zn(OH)_2$, $Co(OH)_3$, $Ni(OH)_2$.
B. Phosphate present: Also $FePO_4$, and alkaline-earth phosphates and carbonates.
Heat with HNO_3 and $KClO_3$.</td></tr>
<tr><td>Precipitate: MnO_2.
Add HNO_3 and H_2O_2.</td><td colspan="3">Solution:
A. $Fe(NO_3)_3$, $Zn(NO_3)_2$, $Co(NO_3)_2$, $Ni(NO_3)_2$. Add NH_4OH (P. 63).
B. Also $Ba(NO_3)_2$, etc., and H_3PO_4. Nearly neutralize with NH_4OH, add NH_4Ac and $Fe(NO_3)_3$, dilute, and boil.†</td></tr>
<tr><td>Solution: $Mn(NO_3)_2$.
Add PbO_2.</td><td rowspan="2">Precipitate:
A. $Fe(OH)_3$.
B. Also $FePO_4$.</td><td colspan="2">Filtrate. Add NH_4OH, pass in H_2S.</td></tr>

QUALITATIVE ANALYSIS SCHEME (Continued)

Supplementary Procedures for Basic Constituents

Boil the substance with NaOH solution.	Boil the substance with H_2SO_4; treat portions of the solution as follows:				
Vapor: NH_3. Absorb in water; add K_2HgI_4.	Add $K_3Fe(CN)_6$.	Add KSCN.	Add $HgCl_2$.	Add HCl.	
	Blue precipitate: $Fe_3(Fe(CN)_6)_2$. (Shows ferrous iron.)	Red color: $Fe(SCN)_3$. (Shows ferric iron.)	Precipitate: Hg_2Cl_2. (Shows stannous tin.)	Precipitate: Hg_2Cl_2 or AgCl. Add NH_4OH.	Filtrate. $HgCl_2$. Add $SnCl_2$.
Orange precipitate: $HgO\cdot Hg_{NH_2}^{I}$. (Shows ammonium.)				Black residue: Hg and $Hg_{NH_2}^{Cl}$. (Shows mercurous mercury.)	Precipitate: Hg_2Cl_2 or Hg. (Shows mercuric mercury.)

Acidic Constituents

Detection of Groups of Acidic Constituents

Sodium Carbonate solution containing all acidic constituents. Treat portions as follows:			
Add $AgNO_3$, $NaNO_2$, and HNO_3	Add HAc, $BaCl_2$, and $CaCl_2$.	Add $MnCl_2$ and HCl.	Add HCl, $FeCl_3$, and $K_3Fe(Cn)_6$.
Precipitate: Chloride-group (S, CN, $Fe(CN)_6{}^{iv}$, $Fe(CN)_6{}^{iii}$, SCN, Cl, Br, I, ClO_3, ClO), as Ag salts.	Precipitate: Sulfate-group (SO_4, SO_3, CrO_4, F, C_2O_4), as Ba and Ca salts.	Dark Color: $MnCl_3$. Shows oxidizing constituents: $Fe(CN)_6{}^{iii}$, ClO_3, ClO, CrO_4, NO_3, NO_2.	Blue precipitate: $Fe_4(Fe(CN)_6)_3$. Shows reducing constituents: S, $Fe(CN)_6{}^{iv}$. I, SO_3, NO_2.

QUALITATIVE ANALYSIS SCHEME (Continued)

Separation of the Chloride-Group into Subgroups

<table>
<tr><td colspan="4">Sodium Carbonate solution containing all acidic constituents. To a portion add $Pb(NO_3)_2$.</td></tr>

Detection of Nitrate, Nitrite, Borate, Arsenate, and Arsenite

Sodium Carbonate solution containing all the acidic constituents. Treat portions as follows:					
Boil with NaOH and Al.	Add HAc and CSN_2H_4.		Add HCl, C_2H_5OH, and turmeric.	Add HCl, NH_4OH, and $Mg(NO_3)_2$.	
Vapor: NH_3. Test with K_2HgI_4.	Gas: N_2.	Solution: NH_4SCN. Add $FeCl_3$.	Orange color. (Shows borate.)	Precipitate: $MgNH_4AsO_4$. Treat with $AgNO_3$.	Filtrate: NH_4AsO_2. Pass in H_2S.
Red precipitate: $HgO \cdot HgNH_2I$. (Shows nitrate or nitrite.)		Red color: $Fe(SCN)_3$.		Red residue: Ag_3AsO_4. (Shows arsenate.)	Yellow precipitate, As_2S_3. (Shows arsenite.)
	(Show nitrite.)				

Detection of Phosphate and the Separate Halides

To portions of the HNO_3 solution of the substance.				
Add $(NH_4)_2MoO_4$.	Add $FeCl_3$.	Add NaAc, HAc, $KMnO_4$ and $CHCl_3$.		
Yellow precipitate: $(NH_4)_3PO_4$, $12MoO_3$. (Shows phosphate.)	Red color: $Fe(SCN)_3$. (Shows thiocyanate.)	Chloroform layer, purple: I_2. (Shows iodide.)	Water layer: add H_2SO_4, more $KMnO_4$ and $CHCl_3$.	
			Chloroform layer, orange: Br_2. (Shows bromide.)	Water layer: Boil out the Br_2, add HNO_3 and $AgNO_3$.

Detection of Readily Volatile Acidic Constituents

Heat the substance with dilute H_2SO_4.

Vapors: CO_2, SO_2, H_2S, NO_2, Cl_2, Br_2, I_2, HCN. Expose to the vapors:

$Ba(OH)_2$ solution.	PbAc paper	Starch and KI paper.	$Fe(OH)_2$ or $Fe(OH)_3$ and NaOH on paper.
White turbidity: $BaCO_3$ or $BaSO_3$. (Shows carbonate, sulphite or thiosulphate.)	Black color: PbS. (Shows sulphide.)	Blue color: I_2 (Shows nitrite, hypochlorite, chlorate, bromate, or iodide.)	Formation of $Na_4Fe(CN)_6$. Dip in HCl.
			Blue color: $Fe_4(Fe(CN)_6)_3$. (Shows cyanide.)

FLAME AND BEAD TESTS

Flame Colorations

Violet

Potassium compounds. Purple red through blue glass. Easily obscured by sodium flame. Bluish green through green glass. Rubidium and Caesium compounds impart same flame as potassium compounds.

Blues

Azure.—Copper chloride. Copper bromide gives azure blue followed by green. Other copper compounds give same coloration when moistened with hydrochloric acid.

Light Blue.—Lead, Arsenic, Selenium.

Greens

Emerald.—Copper compounds except the halides, and when not moistened with hydrochloric acid.

Pure Green.—Compounds of thallium and tellurium.

Yellowish.—Barium compounds. Some molybdenum compounds. Borates, especially when treated with sulphuric acid or when burned with alcohol.

Bluish.—Phosphates with sulphuric acid.

Feeble.—Antimony compounds. Ammonium compounds.

Whitish.—Zinc.

Reds

Carmine.—Lithium compounds. Violet through blue glass. Invisible through green glass. Masked by barium flame.

Scarlet.—Strontium compounds. Violet through blue glass. Yellowish through green glass. Masked by barium flame.

Yellowish.—Calcium compounds. Greenish through blue glass. Green through green glass. Masked by barium flame.

Yellow

Yellow.—All sodium compounds. Invisible with blue glass.

PREPARATION AND PROPER CONCENTRATION OF LABORATORY REAGENTS FOR GENERAL USE

Dilute Acids. Sulfuric acid. One volume concentrated acid to 6 volumes water.

Nitric Acid. One volume concentrated acid to 2 volumes water.

Hydrochloric acid. Five volumes concentrated acid to 8 volumes water.

Acetic acid. One volume concentrated acid to $2\frac{1}{2}$ volumes water.

Dilute Bases. Potassium hydroxide. 280 grams per liter of solution with water.

Sodium hydroxide. 200 grams per liter of solution with water.

Ammonium hydroxide. One volume concentrated ammonia (sp. gr. 90) to 2 volumes water.

Other Reagents. Ammonium sulfide. 600 cc. ammonium hydroxide is saturated with hydrogen sulfide. Dilute to one liter with ammonium hydroxide.

Sodium sulfide. Dissolve 200 grams sodium hydroxide in 800 cc. water. Saturate 400 cc. of this solution with hydrogen sulfide. Add the remaining 400 cc. of sodium hydroxide and dilute the whole to one liter.

Ammonium chloride. 267.5 grams per liter of solution with water.

Ammonium carbonate. 200 grams solid salt dissolved in 350 cc. ammonium hydroxide and dilute with water to 1 liter.

Ammonium acetate. Dilute 300 cc. concentrated acetic acid with 300 cc. water and neutralize with concentrated ammonia. Dilute to 1 liter.

Sodium acetate, 136.14 grams per liter with water.

Sodium phosphate, 119.45 grams per liter with water.

Calcium chloride, 109.51 grams per liter with water.

Magnesium sulfate, 123.28 grams per liter with water.

Barium chloride, 122.17 grams per liter with water.

Ferric chloride, 54.11 grams per liter with water and add sufficient HCl to keep in solution.

Potassium ferrocyanide, 105.72 grams per liter with water.

Lead acetate, 189.51 grams per liter with water.

Stannous chloride, 112.72 grams of the solid salt plus 200 cc. 5N HCl diluted to 1 liter with water. Add metallic tin to the solution in the bottle to keep it from oxidizing.

Mercurous nitrate, 262.34 grams per liter with water. Add sufficient nitric acid to keep solution clear and put metallic mercury in the bottle to prevent oxidation.

Cobalt nitrate, 145 grams per liter with water.

Ammonium oxalate, 35.5 grams per liter with water.

Mercuric chloride, 67.8 grams per liter with water.

Zinc sulfate, 71.9 grams per liter with water.

Manganese sulfate, 55.78 grams per liter with water.

Nickel sulfate, 70.22 grams per liter with water.

Cadmium sulfate, 64.05 grams per liter with water.

Copper sulfate, 62.4 grams per liter with water.

Miscellaneous Reagents. Aqua regia, mix 1 part concentrated HNO_3 with three parts of concentrated HCl.

Silver nitrate N/10, 17 grams per liter with water.

Magnesia mixture, dissolve 68 grams crystallized $MgCl_2$ and 165 grams NH_4Cl in 300 cc. water. Add 300 cc. dilute ammonium hydroxide and dilute to 1 liter.

Molybdate solution, dissolve 60 grams molybdic oxide (MoO_3) in 440 cc. of water and 60 cc. concentrated ammonia (sp. gr. 90). Pour into 500 cc. of cold nitric acid which has been diluted 250 cc. concentrated acid to 250 cc. water. Let stand in a warm place several days. Decant or filter before using.

Phenolsulfonic acid, dissolve 150 grams of phenol in 600 grams of concentrated sulfuric acid.

Yellow ammonium sulfide, 50 to 75 grams of sulfur to a liter of colorless ammonium sulfide.

Ferrous sulfate, dissolve 200 grams $FeSO_4.7H_2O$ in a liter of water. Place scraps of iron in the solution and add a few drops of H_2SO_4 from time to time.

SPECIAL SOLUTIONS AND REAGENTS

Acid Cuprous Chloride. Cover the bottom of a two-liter flask with copper oxide, extend from the top to the bottom of the bottle several pieces of copper wire, and fill the bottle with 1.10 sp. gr. hydrochloric acid. Shake occasionally, and when solution becomes nearly colorless pour into reagent bottles containing copper wire. The stock bottle should be kept filled with 1.10 hydrochloric acid.

Ammoniacal Cuprous Chloride. The acid solution, described above, is treated with ammonia until a slight odor of this reagent is noticeable. Copper wire should be kept in the solution.

Ammonium Molybdate. Mix well 100 gm. of molybdic acid with 400 cc. of distilled water and add 80 cc. of ammonia (sp. gr. 0.90). When complete solution has taken place pour slowly and with stirring into a mixture of 400 cc. of nitric acid (sp. gr. 1.42) and 600 cc. of distilled water. Add 50 milligrams of microcosmic salt, allow to stand 24 hrs. and filter.

Cochineal. Extract 1 gm. of cochineal for four days with 20 cc. of alcohol and 60 cc. of distilled water. Filter.

Congo Red. Dissolve 0.5 gm. of congo red in 90 cc. of distilled water and 10 cc. of alcohol.

Eschka's Compound. Two parts of calcined magnesia are thoroughly mixed with one part of anhydrous sodium carbonate.

Fehling Solution. A. *The Copper Sulphate Solution.* Dissolve 34.66 gm. of copper sulphate ($CuSO_4 \cdot 5H_2O$) in water and dilute to 500 cc. B. *The Alkaline Tartrate Solution.* Dissolve

173 gm. of potassium sodium tartrate (Rochelle salt, $KNaC_4H_4O_6 \cdot 4H_2O$) and 50 gm. of sodium hydroxide in water and dilute when cold to 500 cc. For use, mix equal volumes of the two solutions at the time of using.

Formaldehyde-Sulfuric Acid (Marquis Reagent). Add 10 cc. formaldehyde solution to 50 cc. sulfuric acid.

Fuchsin-Sulfurous Acid. To a solution of 0.5 gm. of fuchsin and 9 gm. of sodium bisulphite in 500 cc. of water add 10 cc. of hydrochloric acid. Keep in well-stoppered bottles and away from light.

Iodo-potassium Iodide (Wagner's Reagent). Dissolve 2 gm. of iodine and 6 gm. of potassium iodide in 100 cc. of water.

Litmus. Extract powder three times with boiling alcohol, each treatment consuming an hour. Treat residue with an equal weight of cold water and filter; then exhaust with five times its weight of boiling water, cool and filter.

Magnesia Mixture. Dissolve 110 gm. of magnesium chloride in a small amount of water. To this solution add 280 gm. of ammonium chloride and 700 cc. of ammonia (sp. gr. 0.90), and dilute to 2000 cc. After standing several hours the solution is filtered. From time to time filter off any silica that may accumulate from the reagent bottle.

Mayer's Reagent. Dissolve 1.35 gm. of mercuric chloride in 60 cc. of water and add to a solution of 5 gm. potassium iodide in 10 cc. of water; add sufficient water to make 100 cc.

Methyl Orange Solution. Dissolve 1 gm. of methyl orange in 1000 cc. of water.

Methyl Red. Dissolve 0.20 gm. of methyl red in 100 cc. of alcohol.

Millon's Reagent. Dissolve 1 part of mercury in 1 part of cold fuming nitric acid. Dilute with twice the volume of water and decant the clear solution after several hours.

Nessler's Solution. Dissolve 50 gm. of potassium iodide in the smallest possible quantity of cold water. Add a saturated solution of mercuric chloride until an excess is indicated by the formation of a precipitate. Add 400 cc. of a 50% solution of potassium hydroxide. Make up to 1 liter, allow to settle, and draw off the clear solution.

Phenolphthalein. Dissolve 1 gm. of phenolphthalein in 50 cc. of alcohol and add 50 cc. water.

Phosphomolybdic Acid (Sonnenschein's Reagent). Prepare ammonium phosphomolybdate and after washing with water, boil with nitric acid and expel NH_3; evaporate to dryness and dissolve in 10% nitric acid.

Phosphotungstic Acid (Scheibler's Reagent). Dissolve 20 gm. sodium tungstate and 15 gm. sodium phosphate in 100 cc. water containing a little nitric acid.

Picric Acid (Hager's Reagent). Dissolve 1 gm. picric acid in 100 cc. water.

Potassium-cadmium Iodide (Marme's Reagent). Add 2 gm. cadmium iodide to a boiling solution of 4 gm. potassium iodide

in 12 cc. water and then mix with an equal volume of saturated potassium iodide solution.

Rosolic Acid. Dissolve 1 gm. rosolic acid in 10 cc. alcohol and add 100 cc. water.

Soap Solution. Dissolve 100 gm. of dry castile soap in 1 liter of 80% alcohol. Allow to stand several days and dilute with 70% to 80% alcohol until 6.4 cc. produces a permanent lather with 20 cc. of standard calcium solution. The latter solution is made by dissolving 0.2 gm. of calcium carbonate in a small amount of dilute hydrochloric acid, evaporating to dryness, and making up to 1 liter.

Sodium Cobaltic Nitrite. Dissolve 4 gm. of cobalt nitrate and 10 gm. of sodium nitrite in 50 cc. of water, add 2 cc. of 36% acetic acid and make up to 100 cc.

Sodium Nitroprusside. Use a freshly prepared solution of 1 gm. sodium nitroprusside in 10 cc. of water.

Sulfanilic Acid. Dissolve 0.5 gm. sulfanilic acid in a mixture of 15 cc. glacial acetic acid and 135 cc. of recently boiled water.

Sulfomolybdic Acid (Froehde's Reagent). Dissolve 10 gm. molybdic acid or sodium molybdate in 100 cc. concentrated sulfuric acid.

Starch. Dissolve 5 gm. of soluble starch in cold water, pour the solution into 2 liters of hot water and boil for a few minutes. Keep in a glass-stoppered bottle.

Starch Solution from other than soluble starch. One part of starch is made into an emulsion with water and this is poured into 200 parts of boiling water, the boiling continued a few minutes, then the solution allowed to stand. Use only the clear solution.

Tannic Acid. Dissolve 1 gm. of tannic acid in 1 cc. of alcohol, and make up to 10 cc. with water.

Tincture of Iodine. To 50 cc. of water add 70 gm. of iodine and 50 gm. of potassium iodide. Make up to 1 liter with alcohol.

Trinitrophenol Solution. Dissolve 1 gm. of trinitrophenol in 100 cc. of water. Cool and filter.

Turmeric Tincture. Digest the ground turmeric root with several small quantities of water which are discarded. Dry the residue and digest it several days with six times its weight of alcohol and filter.

Turmeric Paper. Impregnate white, unsized paper with the tincture, and dry.

STANDARD SOLUTIONS FOR VOLUMETRIC ANALYSIS

Acids

Decinormal Succinic Acid. $H_2C_4H_4O_4$ (5.9023 g. per liter) Dry 5–6 g. of pure succinic acid in an open weighing bottle at 105° for about 10 hours; cool in a desiccator. Weigh out accurately 2.9512 g., brush into a 400 cc. beaker and dissolve in 150–200 cc. of water; pour the solution into a 500 cc. graduated flask, rinsing out the beaker several times to insure complete transference of the acid. Dilute to exactly 500 cc. and mix thoroughly. This prepares an exact decinormal solution.

Standard Hydrochloric Acid Solutions by the Method of G. A. Hulett and W. D. Bonner. *Jour. Am. Chem. Soc.* 31, 390 (1909). Standard HCl is easily prepared by starting with HCl of about d 1.10, made up with an ordinary hydrometer, distilling off and discarding the first three-fourths of the liquid taken; the distillate which is then collected does not differ by more than one part in 10,000 from the values in the table below. This constant boiling acid is not hygroscopic or noticeably volatile and is easily weighed in a small flask. By the use of a capillary pipette, to adjust the last amount of acid, it is a very simple matter to weigh out 180.155 g. to less than 10 mg. and this furnishes sufficient acid to make a liter of normal solution with an accuracy that is seldom attained even with very elaborate precautions.

Bonner and Titus, J.A.C.S., 52, 633 (1930).

500	97.578	1.0993	20.916	1000	116.185	1.0933	19.734	
				1200	122.363	1.0915	19.394	

Normal Hydrochloric Acid. (36.465 g. per liter) (*a*) 180.155 g. of constant boiling point (760 mm.) acid diluted to 1 liter gives an exactly normal solution. (*b*) Concentrated HCl diluted to d 1.020 is approximately normal. (*c*) Concentrated HCl. contains about one-third of its weight of HCl and 120 g. diluted with water to 1 liter will give an acid slightly greater than normal. Solutions prepared as in *b* or *c* are most accurately standardized by precipitation as AgCl.

Normal Sulfuric Acid. (49.04 g. per liter) Take 30 cc. of pure, concentrated H_2SO_4, d 1.84 and pour it cautiously and slowly into about 3–4 volumes of water, cool, mix thoroughly and dilute to 1 liter. Standardize by titration with standard NaOH or KOH solutions with phenolphthalein as indicator. For a decinormal solution use 3 cc. H_2SO_4 per liter and proceed as above. Sulfuric acid is obtained easily in a pure form; the normal acid solution is not affected by boiling (advantage over similar HNO_3

or HCl solutions); when used with lime or similar compounds it gives precipitates and for such cases HCl is preferable.

Normal Nitric Acid. (63.016 g. per liter) Use a colorless acid, d 1.3±, free from chlorine and nitrous acid; a yellow color due to lower oxides of nitrogen is removed by adding about 2 volumes of water, boiling, cooling and then diluting to volume. 65 cc. or 93 g. of acid, d 1.42 diluted to 1 liter gives an acid slightly greater than normal. Standardize by titration with standard alkali.

Normal Oxalic Acid. $H_2C_2O_4$ (63.023 g. $H_2C_2O_4.2H_2O$ or 45.008 g. $H_2C_2O_4$ per liter) Because of the uncertainty in the amount of water of crystallization, standards can not be prepared directly by dissolving a weighed quantity of acid; it is necessary to standardize the solution against alkali of known concentration using phenolphthalein as an indicator. Decinormal or less concentrated solutions are unstable and should be prepared fresh when needed; more concentrated solutions may deposit some of the acid when cooled to low temperatures but they are fairly stable at room temperature when protected from light.

Alkalis

Normal Sodium Hydroxide. * (40.005 g. per liter) Dissolve about 42 g. NaOH in cold water which has been previously boiled to expel CO_2 and dilute to 1 liter with CO_2 free water; a small amount of $BaCl_2$ or $Ba(OH)_2$ solution may be added and after allowing the $BaCO_3$ to settle, the clear supernatant solution is decanted. In preparing the solution exposure to air should be avoided as much as possible. Standardize with normal H_2SO_4 using methyl orange indicator. Solutions thus prepared are slightly greater than normal but after preliminary titration with acid are easily adjusted by the addition of the proper amount of water. The solution must be kept in a bottle with the stopper lubricated with a small amount of vaseline.

Normal Potassium Hydroxide.* (56.108 g. per liter) Proceed as with normal sodium hydroxide using 58 g. KOH.

Decinormal Potassium Hydroxide.* (5.6108g. per liter) Dissolve 7 g. KOH in about 400 cc. of water, add a little $BaCl_2$ solution to precipitate the carbonate and allow to stand about 15 minutes until the $BaCO_3$ settles, filter into a 1 liter flask and without washing the precipitate, dilute to 1 liter with CO_2 free water. Standardize with 0.1 N sulfuric, hydrochloric or succinic acids, using phenolphthalein or methyl orange indicator. Solutions thus prepared are slightly greater than 0.1 N but after preliminary titration with acid are easily adjusted by the addition of the proper amount of water.

Decinormal Sodium Hydroxide.* (4.0005 g. per liter) Dissolve 6 g. NaOH in water and proceed as with 0.1 N KOH.

* The correction factors of NaOH or KOH solutions may change rapidly because of absorption of CO_2 and for this reason should be protected as much as possible from exposure to the air. It is best to standardize these alkaline solutions just before use and when phenolphthalein is used as the indicator to use water which has been boiled recently to expel CO_2 and then cooled. The presence of CO_2 is without effect when methyl orange is the indicator.

Half Normal Ammonium Hydroxide. (17.524 g. per liter) Dilute 28 cc. of ammonium hydroxide, d 0.880 to 1 liter and standardize with sulfuric or hydrochloric acid using cochineal or methyl orange as indicator. Normal solutions of ammonium hydroxide are likely to lose NH_3 at room temperatures.

Oxidizing and Reducing Solutions

Decinormal Potassium Permanganate. $Mn^{vii} \rightarrow Mn^{ii}$ (3.1606 g. per liter) Dissolve 3.3 g. dry $KMnO_4$ in 1 liter distilled water and allow to stand at least 24 hours in a clean glass stoppered bottle. The reasons for not using the freshly prepared solution are: 1st the reducing agents in the water (dust, etc.) are thus all oxidized, and 2nd any MnO_2 formed by this reduction is permitted to settle. The solution is then carefully siphoned through a clean glass tube into clean beakers, discarding the first 25 cc. of solution and the last inch of the solution in the bottle which contains the precipitated MnO_2; the $KMnO_4$ solution should never be permitted to come in contact with rubber, filter paper or other organic matter. The solution in the beakers is now poured back into a clean bottle and standardized against sodium oxalate. Weigh out several samples of 0.25–0.3 g. of a very pure grade and previously dried sodium oxalate and transfer each to 250 cc. Erlenmeyer flasks, add 150 cc. water and 4 cc. concentrated H_2SO_4, heat nearly to boiling and when dissolved run in $KMnO_4$ not faster than 10–15 cc. per minute, swirling the flask rapidly to mix the solutions; the last 1 cc. is added dropwise allowing the solution to decolorize completely before the next addition. The temperature of the solution must be kept above 60°C. and may be heated again if necessary. The addition of $KMnO_4$ is continued until a *faint*, permanent pink is obtained. The first titration may not be exact but will give a fair approximation of the amount necessary for the remaining samples of oxalate. 1 cc. of 0.1 N $KMnO_4$ is equivalent to 0.0067 g. sodium oxalate.

Decinormal Potassium Dichromate. $Cr^{vi} \rightarrow Cr^{iii}$ (4.9037 g. per liter) Dry about 6 g. of $K_2Cr_2O_7$ crystals in an oven for an hour and cool in a desiccator. Weigh out exactly 4.9037 g., place in a liter flask and dilute to exactly 1 liter. This solution is exactly decinormal and can be used for titrating in the standardization of thiosulfate solution. For use in Fe titration it should be checked against pure iron wire by weighing out accurately two samples of wire of 150–200 mg. each. These samples are dissolved separately in beakers with 20 cc. H_2O and 6 cc. HCl. A few particles of carbon may remain undissolved. The solutions are heated nearly to boiling and 2–3 drops of $SnCl_2$ solution are added to reduce any ferric salt formed by oxidation during solution. After cooling and diluting to about 50 cc., an excess of $HgCl_2$ is added (10 cc. of a saturated solution of $HgCl_2$) to reduce the excess $SnCl_2$. The $K_2Cr_2O_7$ solution is added from a burette until within 2 cc. of the quantity calculated from the amount of iron dissolved. The last amount of $K_2Cr_2O_7$ is added slowly and the end point determined using $K_3Fe(CN)_6$

as an external indicator (one small crystal of $K_3Fe(CN)_6$ in 30 cc H_2O). A blue color is obtained as long as ferrous iron is present. When no blue color is obtained after 30 seconds the end point is attained. Since the Fe wire is not absolutely pure, the weight of iron sample is multiplied by the percentage of iron in the wire. 0.005584 g. Fe is equivalent to 1 cc. 0.1 N solution.

Decinormal Sodium Thiosulfate. $2Na_2S_2O_3 \rightarrow Na_2S_4O_6$ (24.8192 g. $Na_2S_2O_3.5H_2O$ per liter) Do not dry the sodium thiosulfate in an oven as it can be obtained almost pure; weigh out 28.50 g. and dilute to exactly 1 liter. After mixing thoroughly the solution is allowed to stand two weeks. If free sulfur has separated, the clear liquid is siphoned off. The solution is standardized indirectly by titration with potassium dichromate (*see above*). Dissolve 5 g. KI and 4 g. $NaHCO_3$ in 300 cc. H_2O in a 500 cc. Erlenmeyer flask at room temperature and then add HCl slowly, swirling the flask, until there is no more evolution of CO_2 and then add about 10 cc. more acid; add 35 cc. 0.1 N $K_2Cr_2O_7$, mixing the solutions, rinse the sides of the flask with a few cc. of water, allowing it to form a layer over the solution without mixing; stopper the flask and allow to stand about 10 minutes. Then with thorough mixing run in thiosulfate until the solution is a light yellow, add a few drops of starch solution and continue with a slow addition of thiosulfate until the bright blue color has disappeared and only the pale green color of $CrCl_3$ remains.

Decinormal Iodine. $I_2 \rightarrow 2HI$ (12.6932 g. per liter) Dissolve about 13.5 g. pure sublimed iodine in a sulution of 24 g. KI in 200 cc. H_2O and dilute to 1 liter. The solution is standardized by adding the iodine to a known volume of standard thiosulfate with a few drops of starch solution for the indicator.

Decinormal Alkaline Arsenite $As^{iii} \rightarrow As^{v}$(4.9465 g. As_2O_3 per liter; equivalent to 0.0126932 g. I or 0.0035457 g. Cl per cc.) Dissolve 4.9465 g. pure sublimed As_2O_3 in a concentrated solution of 4 g. NaOH, add 100 cc. of a saturated $NaHCO_3$ solution and dilute to 1 liter. Do not warm the solution above 60° C. when dissolving the As_2O_3. Standardize against standard iodine solution with a starch indicator.

ACID DILUTION BY VOLUME

The volume of pure acid (or water) which must be added to 50 cm³ of water (or acid) to give solutions of specific gravity shown. Temperature 20°C. Taken from curves prepared by W. W. Stiles, based on experimental determinations. The values are approximate only.

VOLUMETRIC PRIMARY STANDARDS

Compiled by John H. Yoe

The 1933 International atomic weights were used in computing the equivalent weights.

Primary standard	Formula	$\frac{\text{Eq. wt.}}{\text{mol. wt.}}$	Equivalent weight
A. Acidimetry			
s-Diphenylguanidine	$NH{:}C[NHC_6H_5]_2$	1	211.13
Mercuric oxide	HgO	$\frac{1}{2}$	108.31
Potassium acid carbonate	$KHCO_3$	1	100.11
Potassium iodate	KIO_3	$\frac{1}{6}$	35.67
Sodium carbonate	Na_2CO_3	$\frac{1}{2}$	53.00
Sodium oxalate (1)	$Na_2C_2O_4$	$\frac{1}{2}$	67.00
Sodium tetraborate (borax)	$Na_2B_4O_7.10H_2O$	$\frac{1}{2}$	190.72
B. Alkalimetry			
Benzoic acid (1)	C_6H_5COOH	1	122.05
Hydrazine sulfate	$N_2H_4.H_2SO_4$	$\frac{1}{2}$	65.06
Oxalic acid (cryst.) (2)	$H_2C_2O_4.2H_2O$	$\frac{1}{2}$	63.02
Potassium acid oxalate	KHC_2O_4	1	128.11
Potassium acid phthalate (1)	$KHC_8H_4O_4$	1	204.14
Potassium acid tartrate	$KHC_4H_4O_6$	1	188.14
Potassium tetraoxalate	$KH_3(C_2O_4)_2.2H_2O$	$\frac{1}{3}$	84.72
Sodium tetraborate (borax)	$Na_2B_4O_7.10H_2O$	$\frac{1}{2}$	190.72
C. Oxidimetry			
Ferrous sulfate (3)	$FeSO_4.7H_2O$	1	278.01
Ferrous ammonium sulfate (3)	$FeSO_4.(NH_4)_2SO_4.6H_2O$	1	392.14
Iron wire (4)	Fe	1	55.84
Oxalic acid (cryst.) (2)	$H_2C_2O_4.2H_2O$	$\frac{1}{2}$	63.02
Potassium ferrocyanide	$K_4Fe(CN)_6.3H_2O$	1	422.34
Potassium iodate	KIO_3	$\frac{1}{2}$	107.01
Potassium iodide	KI	$\frac{1}{2}$	83.01
Silver	Ag	1	107.88
Sodium oxalate (1)	$Na_2C_2O_4$	$\frac{1}{2}$	67.00
D. Iodimetry			
Arsenous oxide (1)	As_2O_3	$\frac{1}{4}$	49.47
Copper	Cu	1	63.57
Hydrazine sulfate	$N_2H_4.H_2SO_4$	$\frac{1}{4}$	32.531
Iodine (resublimed)	I	1	126.92
Iodine cyanide	ICN	$\frac{1}{2}$	76.464
Oxalic acid (cryst.) (2)	$H_2C_2O_4.2H_2O$	$\frac{1}{2}$	63.02
Potassium bromate	$KBrO_3$	$\frac{1}{6}$	27.836
Potassium diiodate	$KH(IO_3)_2$	$\frac{1}{12}$	32.496
Potassium dichromate	$K_2Cr_2O_7$	$\frac{1}{6}$	49.037
Potassium ferricyanide	$K_3Fe(CN)_6$	1	329.19
Potassium iodate	KIO_3	$\frac{1}{6}$	35.670
Sodium thiosulfate	$Na_2S_2O_3.5H_2O$	1	248.19

VOLUMETRIC PRIMARY STANDARDS (Continued)

Primary standard	Formula	Eq. wt. / mol. wt.	Equivalent weight
E. Silver Nitrate			
Potassium bromide	KBr	1	119.02
Potassium chloride	KCl	1	74.56
Sodium chloride	NaCl	1	58.45
F. Alkali Thiocyanates			
Mercury	Hg	$\frac{1}{2}$	100.31
Mercuric oxide	HgO	$\frac{1}{2}$	108.31
Silver	Ag	1	107.88
Silver nitrate	$AgNO_3$	1	169.89

G. Miscellaneous

For the determination of substances that must pass through complicated reactions, it is best to standardize against a standard sample of the substance that has been carried through all steps of the analysis. The U. S. Bureau of Standards can supply at a nominal fee a large number of standard samples of irons and steels (representing a wide range in composition), iron ores, manganese ore, zinc ore, etc.

(1) May be obtained from the U. S. Bureau of Standards.
(2) Difficult to obtain with exactly two molecules of water but a valuable primary standard when carefully prepared.
(3) The pure salt is hard to obtain and to keep without slight oxidation or loss of water, hence other standards are recommended.
(4) Possesses many disadvantages and is not recommended.
(5) The last few drops of iodine are decolorized very slowly. Titrate till the pale yellow color persists at least two minutes. Starch retards the reaction and should be avoided.

TRUE CAPACITY OF GLASS VESSELS FROM THE WEIGHT OF THE CONTAINED WATER OR MERCURY WHEN WEIGHED IN AIR WITH BRASS WEIGHTS*

A glass vessel containing G grams of water at a temperature of t°C has, at the same temperature, a capacity $V = W_t \times G$ cubic centimeters. Similarly when filled with G grams of mercury at a temperature of t°C the capacity at the same temperature is given by $V = M_t \times G$ cubic centimeters.

A glass vessel containing G grams of water at a temperature of t°C has a capacity at a temperature of 18°C given by $V = W_{18°} \times G$ cubic centimeters. Similarly when filled with G grams of mercury at a temperature of t°C the capacity at a temperature of 18°C is given by $V = M_{18°} \times G$ cubic centimeters. The true volume at temperature of 25°C when the weighing is made at $t°$ is similarly obtained by use of the values under $W_{25°}$ and $M_{25°}$ for water and mercury respectively.

t°C.	W_t	M_t	$W_{18°}$	$M_{18°}$	$W_{25°}$	$M_{25°}$

* Assuming 25×10^{-6} as the coefficient of cubic expansion for glass.

Reduction of Weighings to Vacuo

If the apparent mass of a body is m, its density d_m, the density of the weights d_w and the density of the air d_a the true mass in vacuo is,

$$M = m + md_a\left(\frac{1}{d_m} - \frac{1}{d_w}\right)$$

DECI-NORMAL SOLUTIONS OF SALTS AND OTHER REAGENTS

The weight in grams of the compound in 1 c.c. of the following deci-normal solutions is found by dividing the H equivalent in the last column by 1000.

Name	Formula	At. or mol. wt.	Hydrogen equivalent	One H equiv. in gms.
Acetic acid	$HC_2H_3O_2$	60.03	$HC_2H_3O_2$	6.003
Ammonia	NH_3	17.03	NH_3	1.703
Ammonium	NH_4	18.04	NH_4	1.804
Ammonium chloride	NH_4Cl	53.50	NH_4Cl	5.350
Ammonium sulfate	$(NH_4)_2SO_4$	132.14	$\frac{1}{2}(NH_4)_2SO_4$	6.607
Ammonium sulfocyanate	NH_4CNS	76.11	NH_4CNS	7.611
Barium	Ba	137.36	$\frac{1}{2}Ba$	6.868
Barium carbonate	$BaCO_3$	197.36	$\frac{1}{2}BaCO_3$	9.868
Barium chloride	$BaCl_2.2H_2O$	244.31	$\frac{1}{2}BaCl_2\ 2H_2O$	12.216
Barium hydroxide	$Ba(OH)_2$	171.38	$\frac{1}{2}Ba(OH)_2$	8.569
Barium oxide	BaO	153.36	$\frac{1}{2}BaO$	7.668
Bromine	Br	79.92	Br	7.992
Calcium	Ca	40.08	$\frac{1}{2}Ca$	2.004
Calcium carbonate	$CaCO_3$	100.08	$\frac{1}{2}CaCO_3$	5.004
Calcium chloride	$CaCl_2$	110.99	$\frac{1}{2}CaCl_2$	5.550
Calcium chloride	$CaCl_2.6H_2O$	219.09	$\frac{1}{2}CaCl_2.6H_2O$	10.954
Calcium hydroxide	$Ca(OH)_2$	74.10	$\frac{1}{2}Ca(OH)_2$	3.705
Calcium oxide	CaO	56.08	$\frac{1}{2}CaO$	2.804
Chlorine	Cl	35.46	Cl	3.546
Citric acid	$C_6H_8O_7.H_2O$	210.08	$\frac{1}{3}C_6H_8O_7.H_2O$	7.003
Cobalt	Co	58.94	$\frac{1}{2}Co$	2.948
Copper	Cu	63.57	$\frac{1}{2}Cu$	3.179
Copper Oxide	CuO	79.57	$\frac{1}{2}CuO$	3.979
Copper sulfate	$CuSO_4\ 5H_2O$	249.71	$\frac{1}{2}CuSO_4.5H_2O$	12.485
Cyanogen	CN	26.01	CN	2.601
Hydrochloric acid	HCl	36.47	HCl	3.647
Hydrocyanic acid	HCN	27.02	HCN	2.702
Iodine	I	126.93	I	12.693
Lactic acid	$C_3H_6O_3$	90.05	$C_3H_6O_3$	9.005
Malic acid	$C_4H_6O_5$	134.05	$\frac{1}{2}C_4H_6O_5$	6.702
Magnesium	Mg	24.32	$\frac{1}{2}Mg$	1.216
Magnesium carbonate	$MgCO_3$	84.32	$\frac{1}{2}MgCO_3$	4.216
Magnesium chloride	$MgCl_2$	95.23	$\frac{1}{2}MgCl_2$	4.762
Magnesium chloride	$MgCl_2\ 6H_2O$	203.33	$\frac{1}{2}MgCl_2.6H_2O$	10.167
Magnesium oxide	MgO	40.32	$\frac{1}{2}MgO$	2.016
Manganese	Mn	54.93	$\frac{1}{2}Mn$	2.747
Manganese sulfate	$MnSO_4$	150.99	$\frac{1}{2}MnSO_4$	7.550
Mercuric chloride	$HgCl_2$	271.52	$\frac{1}{2}HgCl_2$	13.576
Nickel	Ni	58.69	$\frac{1}{2}Ni$	2.935
Nitric acid	HNO_3	63.02	HNO_3	6.302
Nitrogen	N	14.01	N	1.401
Nitrogen pentoxide	N_2O_5	108.02	$\frac{1}{2}N_2O_5$	5.401
Oxalic acid	$H_2C_2O_4$	90.02	$\frac{1}{2}H_2C_2O_4$	4.501
Oxalic acid	$H_2C_2O_4.2H_2O$	126.05	$\frac{1}{2}H_2C_2O_4.2H_2O$	6.302
Oxalic anhydride	C_2O_3	72.00	$\frac{1}{2}C_2O_3$	3.600
Phosphoric acid	H_3PO_4	98.04	$\frac{1}{3}H_3PO_4$	3.268

REDUCTIONS OF WEIGHINGS IN AIR TO VACUO

When the weight M in grams of a body is determined in air, a correction is necessary for the buoyancy of the air. The following table is computed for an air density of 0.0012. The corrected weight = M + kM /1000, values of k being found in the table.

Density of body weighed	Correction factor, k.		
	Pt Ir weights	Brass weights	Quartz or Al weights
.5	+2.34	+2.26	+1.95
.6	+1.94	+1.86	+1.55

VOLUMETRIC QUANTITATIVE REACTIONS WITH GRAM EQUIVALENTS

Aluminum

(1) $Al_2(SO_4)_3 + 6KOH = 2Al(OH)_3 + 3K_2SO_4$

$$KOH = \frac{Al_2(SO_4)_3}{6} = \frac{Al_2O_3}{6} = \frac{Al}{3}$$

Antimony

(2) $SbCl_5 + 2KI = SbCl_3 + 2KCl + I_2$

$$I = \frac{Sb}{2} = \frac{Sb_2O_5}{4}$$

(3) $Sb_2O_3 + 2I_2 + 2H_2O = Sb_2O_5 + 4HI$

$$I = \frac{Sb_2O_3}{4} = \frac{Sb}{2}$$

(4) (a) $Sb_2S_3 + 6HCl = 2SbCl_3 + 3H_2S$
(b) $3H_2S + 3I_2 = 6HI + 3S$

$$I = \frac{H_2S}{2} = \frac{Sb_2S_3}{6} = \frac{Sb}{3}$$

(5) $5Sb_2(SO_4)_3 + 4KMnO_4 + 24H_2O = 10H_3SbO_4 + 2K_2SO_4 + 4MnSO_4 + 9H_2SO_4$

$$\frac{4KMnO_4}{20} = \frac{Sb_2(SO_4)_3}{4} = \frac{Sb_2O_3}{4} = \frac{Sb}{2}$$

Arsenic

(6) $As_2O_3 + 2H_2O + 2I_2 = As_2O_5 + 4HI$

$$I = \frac{As_2O_3}{4} = \frac{As}{2}$$

(7) $AsCl_3 + I_2 + 2HCl = AsCl_5 + 2HI$

$$I = \frac{AsCl_3}{2} = \frac{As}{2}$$

(8) As_2S_3 same as reaction 4

Boron

(9) (a) $Na_2B_4O_7 + 2HCl + 5H_2O = 2NaCl + 4H_3BO_3$
(b) $H_3BO_3 + NaOH = NaBO_2 + 2H_2O$

$$NaOH = H_3BO_3 = B$$

Cadmium

(10) $CdS + 2HCl + I_2 = CdCl_2 + 2HI + S$

$$I = \frac{CdS}{2} = \frac{Cd}{2} = \frac{S}{2}$$

Calcium

(11) $5CaC_2O_4 + 2KMnO_4 + 8H_2SO_4 = 5CaSO_4 + K_2SO_4 + 2MnSO_4 + 8H_2O + 10CO_2$

$$\frac{2KMnO_4}{10} = \frac{CaC_2O_4}{2} = \frac{CaCO_3}{2} = \frac{CaO}{2}$$

(12) $CaCO_3 + 2HCl = CaCl_2 + CO_2 + H_2O$

$$HCl = \frac{CaCO_3}{2} = \frac{CaO}{2}$$

VOLUMETRIC QUANTITATIVE REACTIONS WITH GRAM EQUIVALENTS (Continued)

Carbon

(13) $Na_2CO_3 + H_2SO_4 = Na_2SO_4 + H_2O + CO_2$

$$\frac{H_2SO_4}{2} = \frac{Na_2CO_3}{2}$$

(14) $2NaHCO_3 + H_2SO_4 = Na_2SO_4 + 2H_2O + 2CO_2$

$$\frac{H_2SO_4}{2} = \frac{NaHCO_3}{1}$$

(15) $KHC_2O_4 + KOH = K_2C_2O_4 + H_2O$

$$KOH = KHC_2O_4$$

(16) $H_2C_2O_4.2H_2O + 2NaOH = Na_2C_2O_4 + 4H_2O$

$$NaOH = \frac{H_2C_2O_4.2H_2O}{2}$$

(17) $C_6H_5COOH + NaOH = C_6H_5COONa + H_2O$

$$NaOH = C_6H_5COOH$$

(18) $5Na_2C_2O_4 + 2KMnO_4 + 8H_2SO_4 = 5Na_2SO_4 + K_2SO_4 + 2MnSO_4 + 10CO_2 + 8H_2O$

$$\frac{2KMnO_4}{10} = \frac{Na_2C_2O_4}{2}$$

Chlorine

(19) $NaCl + AgNO_3 = AgCl + NaNO_3$

$$NaCl = Cl$$

(20) (a) $Cl + KI = KCl + I$

(b) $I_2 + 2Na_2S_2O_3 = Na_2S_4O_6 + 2NaI$

$$I = Cl$$

(21) $CaOCl_2 + 2HCl = CaCl_2 + H_2O + Cl_2$

$$I = Cl = \frac{CaOCl_2}{2}$$

Chromium

(22) $K_2Cr_2O_7 + 6FeCl_2 + 14HCl = 6FeCl_3 + 2KCl + 2CrCl_3 + 7H_2O$

$$Fe = \frac{K_2Cr_2O_7}{6} = \frac{Cr_2O_3}{6} = \frac{Cr}{3}$$

(23) $K_2Cr_2O_7 + 6KI + 7H_2SO_4 = 4K_2SO_4 + Cr_2(SO_4)_3 + 7H_2O + 3I_2$

$$I = \frac{K_2Cr_2O_7}{6} = \frac{Cr_2O_3}{6} = \frac{Cr}{3}$$

Copper (KMnO₄ Method)

(24) (a) $2CuSO_4 + 2KCNS + H_2SO_3 + H_2O = 2CuCNS + K_2SO_4 + 2H_2SO_4$

(b) $CuCNS + NaOH = NaCNS + CuOH$

(c) $5NaCNS + 6KMnO_4 + 4H_2SO_4 = 3K_2SO_4 + 6MnSO_4 + 5NaCN + 4H_2O$

$$\frac{6KMnO_4}{30} = \frac{NaCNS}{6} = \frac{CuSO_4}{6} = \frac{Cu}{6}$$

VOLUMETRIC QUANTITATIVE REACTIONS WITH GRAM EQUIVALENTS (Continued)

(25) (Iodide Method)

$$2CuSO_4 + 4KI = 2CuI + 2K_2SO_4 + I_2$$
$$I = CuSO_4 = Cu$$

(26) (KCN Method)

(a) $2CuSO_4 + 2NH_4OH = (NH_4)_2SO_4 + Cu_2SO_4(OH)_2$

(b) $Cu_2SO_4(OH)_2 + 6NH_3 + (NH_4)_2SO_4 = 2Cu(NH_3)_4SO_4.H_2O$

(c) $2Cu(NH_3)_4SO_4.H_2O + 7KCN = K_3NH_4Cu_2(CN)_8 + NH_4CNO + 2K_2SO_4 + 6NH_3 + H_2O$

$$\frac{KCN}{2} = \frac{Cu(NH_3)_4SO_4.H_2O}{7} = \frac{CuSO_4}{7} = \frac{Cu}{7}$$

Iodine

(27) $I_2 + 2Na_2S_2O_3 = Na_2S_4O_6 + 2NaI$

$$I = Na_2S_2O_3$$

(28) $KIO_3 + 5KI + 6HCl = 6KCl + 3H_2O + 3I_2$

$$I = \frac{KIO_3}{6} = \frac{5KI}{6}$$

(29) $10KI + 2KMnO_4 + 8H_2SO_4 = 6K_2SO_4 + 2MnSO_4 + 8H_2O + 5I_2$

$$\frac{2KMnO_4}{10} = I$$

Iron

(30) $6FeCl_2 + K_2Cr_2O_7 + 14HCl = 6FeCl_3 + 2KCl + 2CrCl_3 + 7H_2O$

$$\frac{K_2Cr_2O_7}{6} = \frac{6FeCl_2}{6} = \frac{Fe_2O_3}{2} = \frac{Fe}{1}$$

(31) $10FeSO_4 + 2KMnO_4 + 8H_2SO_4 = 5Fe_2(SO_4)_3 + K_2SO_4 + 2MnSO_4 + 8H_2O$

$$\frac{2KMnO_4}{10} = \frac{10FeSO_4}{10} = \frac{Fe_2O_3}{2} = \frac{Fe}{1}$$

(32) $2FeCl_3 + 2KI = 2KCl + 2FeCl_2 + I_2$

$$I = FeCl_3 = Fe = \frac{Fe_2O_3}{2}$$

Lead

(33) $2Pb(C_2H_3O_2)_2 + K_2Cr_2O_7 + H_2O = 2PbCrO_4 + 2KC_2H_3O_2 + 2HC_2H_3O_2$

$$\frac{2Pb}{4} = \frac{K_2Cr_2O_7}{4}$$ (as precipitating agent for lead)

(34) $2PbCrO_4 + 6KI + 16HCl = 2PbCl_2 + 6KCl + 2CrCl_3 + 8H_2O + 3I_2$

$$I = \frac{PbCrO_4}{3} = \frac{Pb}{3} = \frac{K_2Cr_2O_7}{6}$$

VOLUMETRIC QUANTITATIVE REACTIONS WITH GRAM EQUIVALENTS (Continued)

Manganese

(35) $MnO_2 + H_2SO_4 + H_2C_2O_4 = MnSO_4 + 2CO_2 + 2H_2O$

$$\frac{2KMnO_4}{10} = \frac{C_2H_2O_4}{2} = \frac{MnO_2}{2} = \frac{Mn}{2}$$

(36) (Bismuthate Method)

(a) $2Mn(NO_3)_2 + 5NaBiO_3 + 16HNO_3 = 5NaNO_3 + 5Bi(NO_3)_3 + 7H_2O + 2HMnO_4$

(b) $2HMnO_4 + 5Na_3AsO_3 + 4HNO_3 = 5Na_3AsO_4 + 2Mn(NO_3)_2 + 3H_2O$

$$\frac{2HMnO_4}{10} = \frac{Na_3AsO_3}{2} = \frac{Mn}{5}$$

(37) (Persulfate Method)

(a) $2Mn(NO_3)_2 + 5(NH_4)_2S_2O_8 + 8H_2O = 5(NH_4)_2SO_4 + 4HNO_3 + 5H_2SO_4 + 2HMnO_4$

(b) $2HMnO_4 + 10FeSO_4 + 7H_2SO_4 = 5Fe_2(SO_4)_3 + 2MnSO_4 + 8H_2O$

$$\frac{2HMnO_4}{10} = \frac{10FeSO_4}{10} = \frac{Mn}{5}$$

(38) (Volhard's Method)

$3MnSO_4 + 2KMnO_4 + 2H_2O = 5MnO_2 + K_2SO_4 + 2H_2SO_4$ *or*

$6MnSO_4 + 5ZnSO_4 + 4KMnO_4 + 14H_2O = 4KHSO_4 + 7H_2SO_4 + 5Zn(OH)_2.2MnO_2$

$$\frac{2KMnO_4}{10} = \frac{3MnSO_4}{10} = \frac{3Mn}{10}$$

(39) (Ford Williams Method)

$MnO_2 + 2FeSO_4 + 2H_2SO_4 = MnSO_4 + Fe_2(SO_4)_3 + 2H_2O$

$$\frac{2FeSO_4}{2} = \frac{MnO_2}{2} = \frac{Mn}{2}$$

Molybdenum

(40) (a) $2MoO_3 + 3Zn = Mo_2O_3 + 3ZnO$

(b) $5Mo_2O_3 + 6KMnO_4 + 9H_2SO_4 = 10MoO_3 + 3K_2SO_4 + 6MnSO_4 + 9H_2O$

$$\frac{6KMnO_4}{30} = \frac{Mo_2O_3}{6} = \frac{MoO_3}{3} = \frac{Mo}{3}$$

Nickel (KCN Method)

(41) (a) $2NiSO_4 + 12NH_4OH = 2Ni(NH_3)_6SO_4 + 12H_2O$

(b) $Ni(NH_3)_6SO_4 + 4KCN = K_2Ni(CN)_4 + K_2SO_4 + 6NH_3$

$$\frac{4KCN}{8} = \frac{Ni(NH_3)_6SO_4}{8} = \frac{Ni}{8}$$

Oxygen

(42) $5H_2O_2 + 2KMnO_4 + 4H_2SO_4 = 2KHSO_4 + 2MnSO_4 + 8H_2O + 5O_2$

VOLUMETRIC QUANTITATIVE REACTIONS WITH GRAM EQUIVALENTS (Continued)

$$\frac{2KMnO_4}{10} = \frac{H_2O_2}{2}$$

Phosphorus

(43) (a) $H_3PO_4 + 12(NH_4)_2MoO_4 + 21HNO_3 = (NH_4)_3PO_4.12MoO_3 + 21NH_4NO_3 + 12H_2O$

(b) $2(NH_4)_3PO_4.12MoO_3 + 46NaOH + H_2O = 2(NH_4)_2HPO_4 + (NH_4)_2MoO_4 + 23Na_2MoO_4 + 23H_2O$

$$\frac{NaOH}{1} = \frac{2(NH_4)_3PO_4.12MoO_3}{46} = \frac{P_2O_5}{46} = \frac{P}{23}$$

(44) (a) $2(NH_4)_3PO_4.12MoO_3 + 46NH_4OH + H_2O = 24(NH_4)_2MoO_4 + 2(NH_4)_2HPO_4 + 23H_2O$

(b) $(NH_4)_2MoO_4 + H_2SO_4 = (NH_4)_2SO_4 + H_2MoO_4$

(b) $10FeSO_4 + 2KMnO_4 + 8H_2SO_4 = 5Fe_2(SO_4)_3 + K_2SO_4 + 2MnSO_4 + 8H_2O$

$$\frac{2KMnO_4}{10} = \frac{FeSO_4}{1} = \frac{Zn}{2}$$

(60) $3ZnCl_2 + 2K_4Fe(CN)_6 = K_2Zn_3(Fe(CN)_6)_2 + 6KCl$

$$\frac{K_4Fe(CN)_6}{3} = \frac{3ZnCl_2}{.6} = \frac{Zn}{2}$$

EFFICIENCY OF DRYING AGENTS

Compiled by John H. Yoe

A. Drying agents depending upon chemical action (absorption) for their efficiency:*

Substance	Weights of residual water vapor in dried air—mg per liter	Authority
P_2O_5	Much less than 1 mg in 40,000 liters	Morley
$Mg(ClO_4)_2$ anh	Unweighable in 210 liters	Willard and Smith
$Mg(ClO_4)_2.3H_2O$	Unweighable in 57 liters	Willard and Smith
BaO	....	Booth and McIntire
$CaSO_4.\frac{1}{2}H_2O$	....	Smith
KOH (fused)	0.002	Baxter and Starkweather
H_2SO_4	0.003	Baxter and Starkweather
MgO	0.008	Dover and Marden
NaOH (fused)	0.16	Baxter and Starkweather
$CaBr_2$	0.2	Baxter and Warren
CaO	0.2	Dover and Marden
B_2O_3	....	Walton and Rosenbaum
$Ba(ClO_4)_2$ anh	....	Smith
$CaCl_2$ (granular)	0.14 to 0.25	McPherson
$CaCl_2$ (fused)	0.36	Baxter and Starkweather
$ZnCl_2$	0.8	Baxter and Warren
$ZnBr_2$	1.1	Baxter and Warren
$CuSO_4$ anh	1.4	Dover and Marden

B. Drying agents depending upon physical action (adsorption) for their efficiency:*—Alumina (low temperature fired), asbestos, charcoal, clay and porcelain (low temperature fired), glass wool, kieselguhr, silica gel, refrigeration.

* It should be noted that the efficiency of some drying agents (*e. g.* $Al_2O_3.xH_2O$ and anhydrous $CaCl_2$, and probably also BaO, anhydrous $Mg(ClO_4)_2$, $Mg(ClO_4)_2.3H_2O$, anhydrous $Ba(ClO_4)_2$, and $CaSO_4.\frac{1}{2}H_2O$) depends upon both adsorption and absorption.

ONE HUNDRED COMPLETED CHEMICAL EQUATIONS

1. $H_2PtCl_6 + 2KCl = 2HCl + K_2PtCl_6$
2. K_2PtCl_6 + heat $= 2KCl + Pt + 2Cl_2$
3. $KHC_4H_4O_6 + NaOH = KNaC_4H_4O_6 + H_2O$
4. $Na_2O_2 + 2H_2O = 2NaOH + H_2O_2$
5. $2KMnO_4 + 3H_2SO_4 + 5H_2O_2 = K_2SO_4 + 2MnSO_4 + 8H_2O + 5O_2$
6. $2KI + H_2O_2 = 2KOH + I_2$
7. $2AuCl_3 + 3H_2O_2 + 6NaOH = 6NaCl + 6H_2O + 3O_2 + 2Au$
8. $MnCl_2 + 2KOH + H_2O_2 = 2KCl + H_2O + MnO.(OH)_2$, (brown)
9. $2NiCl_2 + 4KOH + H_2O_2 = 4KCl + 2Ni(OH)_3$ (black)
10. $2CoCl_2 + 4KOH + H_2O_2 = 4KCl + 2Co(OH)_3$ (black)
11. $MgCl_2 + Na_2HPO_4 + NH_3 = 2NaCl + MgNH_4PO_4$
12. $2BaCl_2 + K_2Cr_2O_7 + H_2O = 2BaCrO_4 + 2HCl + 2KCl$
13. $AlCl_3 + 3KOH = 3KCl + Al(OH)_3$
14. $Al(OH)_3 + 3KOH = 3H_2O + Al(OK)_3$

A METHOD OF BALANCING EQUATIONS FOR OXIDATION-REDUCTION REACTIONS

On the left-hand side of the equation write the formulae for all the compounds entering into the reaction. On the right-hand side write the formulae for all the compounds formed in the reaction.

Determine the L. C. M. (least common multiple) of the numbers representing the changes in valence per molecule of the oxidizing and reducing agents.

The quotient obtained in dividing the L. C. M. by the number representing the valence change per molecule is the number of molecules of that compound required, or formed.

The reaction between $FeSO_4$, $KMnO_4$, and H_2SO_4 serves to illustrate. Following the rule as given above we write, $KMnO_4 + FeSO_4 + H_2SO_4 \longrightarrow K_2SO_4 + MnSO_4 + Fe_2(SO_4)_3 + H_2O$.

The valence change of manganese is five, that of iron is two per molecule of $Fe_2(SO_4)_3$. The L. C. M. of these two numbers is ten.

The quotient obtained by dividing the L. C. M. by the valence change of manganese is two. Therefore two molecules of $KMnO_4$ are required. The quotient obtained by dividing the L. C. M. by the valence change of iron per molecule of $Fe_2(SO_4)_3$ is five. Five molecules of $Fe_2(SO_4)_3$ are formed. Ten molecules of $FeSO_4$ are needed. From the two molecules of $KMnO_4$ used one molecule of K_2SO_4 is formed, as well as two molecules of $MnSO_4$.

Eighteen sulfate radicals are used in forming the salts; ten of these radicals are supplied by the $FeSO_4$ used, the other eight must be supplied by the free acid. The sixteen hydrogens form eight molecules of water.

The complete equation is, therefore,

$$2KMnO_4 + 10FeSO_4 + 8H_2SO_4 \longrightarrow K_2SO_4 + 2MnSO_4 + 5Fe_2(SO_4)_3 + 8H_2O.$$

PROBLEMS

THE METHOD OF SOLVING CHEMICAL PROBLEMS

(From Talbot's Quantitative Analysis, by permission.)

Detailed solutions of a few typical problems are given below. The student should study these carefully, and assure himself that they are fully understood.

1. A "chemical factor" expresses the ratio between a specific quantity of a chemical compound and the *equivalent* quantity of some other body. For example, if it is wished to determine the weight of sulfur which corresponds to a specific weight of barium sulfate, the latter is multiplied by the factor, or ratio, represented by the fraction $\frac{S}{BaSO_4}$, or $\frac{32.07}{233.50} = 0.1373$. It may also be expressed by the proportion $\overset{233.5}{BaSO_4} : \overset{32.07}{S} = \text{wt. } BaSO_4 : x$, from which it is plain that $x = \frac{32.07}{233.50} \cdot \text{wt. } BaSO_4$.

Again, if the weight of FeO in Fe_2O_3 is desired, the factor becomes $\frac{2\ FeO}{Fe_2O_3} = \frac{144.04}{160.04} = 0.9000$. Similarly, the factor for the conversion of KCl to K_2O is $\frac{K_2O}{2\ KCl} = \frac{94.22}{149.12} = 0.6320$. The logarithmic equivalents of these values are called log factors.

In the calculation of these factors, the atomic or molecular relations of the two substances must be kept clearly in mind; thus, it is plainly *incorrect* to express the ratio of ferrous to ferric oxide by the fraction $\frac{FeO}{Fe_2O_3}$, since each molecule of the higher oxide must correspond to two molecules of the lower. Carelessness in this respect is one of the most frequent sources of error.

2. To calculate the volume of a reagent required for a specific operation, it is necessary to know the exact reaction which is to be brought about, and, as with the calculation of factors, to keep in mind the molecular relations between the reagent and the substance reacted upon. For example, to estimate the weight of barium chloride necessary to precipitate the sulfur from 0.1 gram of pure pyrite (FeS_2), the proportion should stand $\overset{488.70}{2BaCl_2.2\ H_2O} : \overset{120.16}{FeS_2} = x : 0.1$, where x represents the weight

of the chloride required. Each of the two atoms of sulfur will form a molecule of sulfuric acid upon oxidation, which, in turn, will require a molecule of the barium chloride for precipitation. To determine the quantity of the barium chloride required, it is necessary to include in its molecular weight the water of crystallization, since this is inseparable from the chloride when it is weighed. This applies equally to other similar instances.

If the strength of an acid is expressed in percentage by weight, due regard must be paid to its specific gravity. For example, hydrochloric acid (sp. gr. 1.12) contains 23.8 per cent HCl by weight; *i.e.*, 0.2666 gram.

3. No rules for universal application to "indirect gravimetric analyses" can be laid down. A single example will be explained.

Given a mixture of KCl + NaCl weighing 0.15 gram, which contains 53 per cent chlorine, to calculate the weight of KCl and NaCl in the mixture.

The weight of chlorine in the mixture is (0.15 × 0.53) or 0.0795 gram. Assuming that this chlorine was all in combination with potassium, the corresponding weight of KCl would be 0.1672 gram (Cl : KCl = 0.0795 : 0.1672). This is an excess of 0.0172 gram over the actual weight of the mixture, and it is plain that this difference is occasioned by the replacement of certain of the molecules of potassium chloride, weighing 74.56 units, by molecules of sodium chloride weighing 58.50 units. To express this, let it be supposed that the mixture is made up of n molecules KCl and n' molecules NaCl; then it may be said that $n\ \overset{74.56}{\mathrm{KCl}} + n'\ \overset{58.50}{\mathrm{NaCl}} = 0.15$ gram, and $n\ \overset{74.56}{\mathrm{KCl}} + n'\ \overset{74.56}{\mathrm{KCl}} = 0.1672$ gram, then by subtracting the first equation from the second it is shown that $n'\ (\overset{74.56}{\mathrm{KCl}} - \overset{58.50}{\mathrm{NaCl}}) = 0.0172$ gram. That is, the difference in weight is equal to n' times the difference in the molecular weights of the two chlorides. The actual weight of NaCl present (x) is equal to $58.50n'$, or, since $n' = \frac{0.0172}{74.56 - 58.50}$, $x = 58.50\left(\frac{0.0172}{74.56 - 58.50}\right)$. This may be expressed in the form $(74.56 - 58.50) : 58.50 = 0.0172 : x$, from which $x = 0.0626$. The weight of NaCl subtracted from that of the mixture gives the weight of KCl.

The weights of the chlorides may also be calculated algebraically by solving the equations $x + y = 0.15$ and $\frac{35.45}{74.56}x + \frac{35.45}{58.50}y = 0.0795$, where x is the weight of KCl and y is the weight of NaCl in the mixture.

4. It is sometimes desirable to weigh out such a quantity of substance for analysis, that the number of cubic centimeters of standard solution entering into the reaction shall represent directly the percentage of the desired constituent. This may be

readily done, by considering the relation of the solution to a normal solution and the atomic or molecular weight of the desired component. For example, suppose it is desired to calculate such a weight for K_2CO_3 in pearl ash, when a half-normal acid solution is used. Since half-normal acid and alkali solutions are equivalent, and since by definition the half-normal K_2CO_3 solution contains 34.55 grams per liter, each cubic centimeter of the acid solution must be equivalent to 0.03455 gram K_2CO_3. Hence, 100 cc. would neutralize 3.455 grams pure K_2CO_3 and this becomes the desired weight of the pearl ash. Similarly the required weight of limonite where the iron (Fe) is to be determined by means of a deci-normal $K_2Cr_2O_7$ solution is 0.5602 gram.

5. One of the most frequently recurring cases in volumetric analysis is that in which it is wished to express the value of a specific solution in terms of some substance other than that against which it has been standardized as for instance, the value of a permanganate solution which has been standardized against oxalic acid, in terms of iron. Although such problems apparently vary widely, there are common principles which can be applied to them all. These are stated below, and the student should assure himself that they are fully understood.

Suppose, for example, it is desired to find the iron value (Fe) of a permanganate solution, of which 1 cc. is equivalent to 0.006302 gram $C_2H_2O_4 . 2H_2O$.

From a comparison of the reactions it is seen that 10 molecules of ferrous sulfate and 5 molecules of oxalic acid each react with the same amount (2 molecules) of the permanganate. These two quantities being, then, equivalent to the same third quantity, must be equivalent to each other; in other words, 10 molecules of ferrous sulfate and 5 molecules of oxalic acid have the same reducing power. But, as stated above, the value is desired in terms of metallic iron (Fe), not $FeSO_4$, but as it is plain that $10FeSO_4$ are equivalent to 10Fe, it is proper to make the proportion

$$\overset{560.2}{10\ \mathrm{Fe}} : \overset{630.25}{5C_2H_2O_4 . 2\ H_2O} = x : 0.006302$$

in which $x = 0.005602$ gram. Here, again, as in example 2, it is necessary to include the water of crystallization in the molecular weight of the oxalic acid, as it is weighed with it.

The same conclusion is arrived at, if we consider the relation of the solution to the normal. As given, it is deci-normal and must, therefore, be equivalent to a deci-normal solution of iron. From the equations cited, it is seen that $10FeSO_4$, unite with 5O, therefore each molecule is equivalent to 1 hydrogen atom in reducing power. The normal solution must, then, contain 1 gram-molecule of ferrous sulfate, or 56.02 grams Fe, and each cubic centimeter of the deci-normal solution would contain 0.005602 gram, the value obtained above.

Again, suppose the value of the same permanganate solution were desired in terms of molybdenum (Mo), the reactions with permanganate being

$5Mo_{12}O_{19} + 17Mn_2O_7 = 60MoO_3 + 34MnO$, and
$5C_2H_2O_4.2H_2O + Mn_2O_7 = 2MnO + 10CO_2 + 15H_2O$.
(Mn_2O_7 is the anhydride of $HMnO_4$.)

It is plain that in these equations as they stand, the molecular quantities of oxidizing agent are not equal. They can be made so by simply multiplying the second equation by 17, and they then become,

$5Mo_{12}O_{19} + 17Mn_2O_7 = 34MnO + 60MoO_3$, and
$85C_2H_2O_4.2H_2O + 17Mn_2O_7 = 34MnO + 170\ CO_2 + 255\ H_2O$.

It is now possible to reason in the same way as before, and to conclude that 85 molecules of the oxalic acid have the same reducing power as 5 molecules of the oxide $Mo_{12}O_{19}$, or 60 atoms of molybdenum. Accordingly,

$$\overset{5758.8}{60Mo} : \overset{10714.25}{85C_2H_2O_4.2H_2O} :: x : 0.006302$$

in which x 0.003387 gram.

Since $5Mo_{12}O_{19}$ unite with 85O, a normal solution of the former as a reducing agent, would contain 1/170 of the 5 gram-molecules or 33.87 grams Mo, and the deci-normal solution 3.387 grams per liter. This agrees with the values already obtained.

6. It is sometimes necessary to calculate the value of solutions according to the principles just explained, when several successive reactions are involved. Such problems may be solved by a series of proportions, but it is usually possible, after stating these to eliminate the common factors and solve but a single one.

For example, suppose it is desired to express the value of a permanganate solution, of which 1 cc. = 0.008 gram iron (Fe), in terms of calcium oxide (CaO). The reactions involved in the volumetric determination of calcium are the following; $CaCl_2 + (NH_4)_2C_2O_4 = CaC_2O_4 + 2NH_4Cl$; $CaC_2O_4 + H_2SO_4 + 2H_2O = CaSO_4 + C_2H_2O_4.2H_2O$; $5C_2H_2O_4.2H_2O + 2KMnO_4 + 3H_2SO_4 = K_2SO_4 + MnSO_4 + 10CO_2 + 18H_2O$.

From the considerations stated under 5, the following proportions may be made.

$$10Fe : 5C_2H_2O_4.2H_2O = 0.008 : x$$
$$5C_2H_2O_4.2H_2O : 5CaC_2O_4 = x : y$$
$$5CaC_2O_4 : 5CaO = y : x$$

Canceling the common factors, there remains simply

$$\overset{560.2}{10Fe} : \overset{280.4}{5\ CaO} = 0.008 : z$$

Similarly, from the reactions, the equivalent of the iodine liberated may be calculated in terms of MnO_2 as follows: Supposing the weight of iodine to be 0.5 gram then

$$2I : 2KI = 0.5 : x$$
$$2KI : 2Cl = x : y$$
$$2Cl : 2HCl = y : z$$
$$2HCl : MnO_2 = z : w$$

Canceling the common factors, there remains

$$2I : MnO_2 = 0.5 : w$$

SOLUBILITY OF INORGANIC COMPOUNDS IN WATER

The table shows the number of grams of the anhydrous substance indicated in the first column which can be dissolved in 100 grams of water at the temperature in degrees Centigrade given at the top. When the formula is preceded by a * the solubility is stated in grams of anhydrous substance in 100 grams of saturated solution; when preceded by ** the solubility is stated in grams of anhydrous substance in 100 c.c. of the saturated solution. The column headed with S. P. shows the solid phase hydrated form in equilibrium with the saturated solution.

SOLUBILITY OF

α, the absorption coefficient, is the volume of gas when reduced to 0° and 760 mm., absorbed by one volume of water when the pressure of the gas itself, without the aqueous tension, amounts to 760 mm.

q is the weight of gas in grams dissolved in 100 grams of water when the total pressure (i.e., the sum of the partial pressure of the gas plus the aqueous tension at the given temperature) is 760 mm.

GASES IN WATER

l is the volume of gas in c.c. dissolved by one volume of water when the total pressure (i.e., the sum of the partial pressure of the gas plus the aqueous tension at the given temperature) is 760 mm.

	Carbon Monoxide		Hydrogen Sulfide		Sulfur Dioxide		Nitric Oxide		Air**

TABLE OF INDICATORS

Due to hydrolysis of the salt formed, the composition of a weak acid solution titrated against a strong base is basic (when equivalent amounts of acid and base are present) and of a weak base against a strong acid is acid. A truly neutral titrated solution has the same concentration of hydrogen ions $[H^+]$ and hydroxyl ions $[OH^-]$ as water. Water has a concentration of $[H^+]$ ion of 10^{-7} and of $[OH^-]$ ion of 10^{-7} at 25°C. As an index of the acid intensity the expression pH is employed and is equal to the logarithm of the reciprocal of the hydrogen ion concentration; i. e., $pH = \log \frac{1}{[H^+]}$ per liter. From this it follows that the pH of a neutral solution is the same as that of water; viz., 7; an acid solution has a pH less than 7 and a basic solution has a pH greater than 7. Those indicators in the table below with a * are the Sörensen selected indicators; those with a # are the Clark and Lubs selected indicators; those with the ## are Cohen's supplement to the Clark and Lubs selection; those with the *E* are the Eastman indicators.

Dinitrohydroquinone Acetate	....	9–10 E	
Alizarin Yellow R...	Sodium p-nitrobenzene-azo-salicylate	9–10 E	
Tetranitrophenolsulfonphthalein	....	9–10 E	
Thymolphthalein.....	....	9.3–10.5 * 10–11 E	
Alizarin Yellow G....	p-nitrobenzene-azo-salicylic acid	10.1–12.1 *	
Alizarin Blue S......	....	11–13	Prideaux
Poirrier's Blue.......	....	11–13	Prideaux
Tropeolin 0..........	Resorcine-azo-benzene-sulfonic acid	11.1–12.7 *E	
Sodium Indigodisulfonate............	....	12–14 E	
1,3,5-Trinitrobenzene	....	14–14.3 E	

[2] Phenolphthalein may be used in the presence of weak acids.

PREPARATION OF CLARK AND LUBS INDICATOR SOLUTIONS

To prepare a 0.04% indicator reagent, 0.1 gram of the dry indicator is mixed in a mortar with the number of cubic centimeters of 0.01 *N* sodium hydroxide as given in the table below and the mixture diluted to 250 cc with water. Such solutions give satisfactory results when five drops of indicator are added to 10 cc of the solution to be tested.

Indicator	0.01 *N* NaOH cc	Indicator	0.01 *N* NaOH cc
Brom cresol green	14.3	Chlor phenol red	23.6
Brom cresol purple	18.5	Cresol red	26.2
Brom phenol blue	14.9	Meta cresol purple	26.2
Brom phenol red	19.5	Phenol red	28.2
Brom thymol blue	16.0	Thymol blue	21.5

CONVERSION FACTORS—pH TO E. M. F.

When the half-cell:

KCl (saturated)|KCl (0.1*N*), HgCl (s)|Hg is used as a standard of reference and it is assumed, arbitrarily that in the cell:

$$\underset{A}{\text{Pt, } H_2 \text{ (1 atmosphere)}}|\text{H}^+ \text{ (unknown activity)}\underset{B}{|}\text{KCl (saturated)}\underset{C}{|}\text{KCl (0.1}N\text{), HgCl (s)}\underset{D}{|}\text{Hg}$$

the potential difference at **B** remains constant with variations of "H (unknown activity)" and that the sum of the potential differences at **B, C** and **D** is Σ as follows: (cf. Clark: *Determination of Hydrogen Ions*, 3d Ed., 1928).

t°C	18	20	25	30
Potential difference (Σ) volts	0.3380	0.3379	0.3376	0.3371

t°C	35	38	40
Potential difference (Σ) volts	0.3365	0.3361	0.3358

then,

$$pH = \frac{\text{E. M. F.} - \Sigma}{0.00019832 \times T}$$ where T is the absolute temperature.

CALOMEL ELECTRODE

The voltage of the calomel electrode at 25°C. is for the half-cell:

$$Hg|HgCl, (N)\ KCl|| = +0.2822$$
$$Hg|HgCl, (0.1N\ KCl)|| = +0.3376$$
$$Hg|HgCl, (saturated)\ KCl|| = +0.2458$$

From this the relation of the E. M. F. and pH (of a cell composed of a hydrogen electrode and one of the calomel electrodes) is given by:

$$pH = \frac{E.\ M.\ F. - \Sigma}{0.0591} \text{ (at 25°C.)}$$

QUINHYDRONE ELECTRODE

The normal electrode potential (E_h) of the quinhydrone electrode referred to the normal hydrogen electrode at t°C. is given by the expression:

$$E_h = 0.7177 - 0.00074t$$

McILVAINE'S STANDARD BUFFER SOLUTIONS

Stock solution A: 0.1 molar citric acid ($C_6H_8O_7$) solution.
Stock solution B: 0.2 molar disodium phosphate (Na_2HPO_4) solution.

pH VALUES FOR POTENTIOMETER READINGS

Harold V. Gaskill

The following table presents pH values for various potentiometer readings using the quinhydrone half-cell and saturated calomel half-cell at 25°C. The argument is potential in millivolts and the table entries are in terms of pH. The table was constructed upon the following formula:

$$\text{pH} = \frac{0.4538 - E_q}{0.0591}$$

in which E_q is the observed potential in volts.[1]

The temperature factor is 0.77 millivolts per degree, to be added above 25°C and subtracted below 25°C.

Polarity is reversed above 7.68 pH.

Milli-volts	.0	.1	.2	.3	.4	.5	.6	.7	.8	.9

SOLUBILITY OF CANE SUGAR IN WATER

Grams of sugar in 100 grams of water, temperature in degrees Centigrade.

	0°	10°	20°	30°	40°	50°	60°	70°	80°	90°	100°
$C_{12}H_{22}O_{11}$	179.2	190.5	203.9	219.5	238.1	260.4	287.3	320.5	362.1	415.7	487.2

The values below give the per cent by weight of sugar in the final solution:

Temp., °C.	Per cent sugar	Temp., °C.	Per cent sugar	Temp., °C.	Per cent sugar
0	64.18	35	69.55	70	76.22
5	64.87	40	70.42	75	77.27
10	65.58	45	71.32	80	78.36
15	66.53	50	72.25	85	79.46
20	67.09	55	73.20	90	80.61
25	67.89	60	74.18	95	81.77
30	68.80	65	75.88	100	82.97

DEGREE OF IONIZATION

In Normal Solution at 18° Unless Indicated

Acids

Nitric acid	0.82
Hydrochloric acid	0.784
Sulfuric acid	0.510
Hydrofluoric acid	0.070
* Oxalic acid	0.500
* Tartaric acid	0.082
Acetic acid	0.004
* Carbonic acid	0.0017
* Hydrogen sulfide	0.0007
* Boric acid	0.0001
* Hydrocyanic acid	0.0001
† Permanganic acid	0.933
† Hydriodic acid	0.901
† Hydrobromic acid	0.899
† Perchloric acid	0.880
† Chloric acid	0.878
† Hydrochloric acid	0.876
† Phosphoric acid	0.170

* In o.1 M. solution; primary ionization.
† In N/2 solution, at 25°.

Bases

Potassium hydroxide	0.77
Sodium hydroxide	0.73
Barium hydroxide	0.69
Lithium hydroxide	0.63
Ammonium hydroxide	0.004
Tetramethyl ammonium hydroxide	0.96
‡ Strontium hydroxide	0.93
‡ Barium hydroxide	0.92
‡ Calcium hydroxide	0.90

‡ In N/64 solution, at 25°.

Salts

Approximate degree of ionization for active salts in N/10 solution:

Type R^+R^- (e.g. KCl)	0.86
Type $R^{++}(R^-)_2$ (e.g. $BaCl_2$)	0.72
Type $(R^+)_2R^{--}$ (e.g. K_2SO_4)	0.72
Type $R^{++}R^{--}$ (e.g. $BaSO_4$)	0.45

SOLUBILITY PRODUCT

The solubility product (or ion product constant) is the product of the concentrations of the ions in the saturated solution of a difficultly soluble salt. The concentrations are expressed as moles per liter of solution. The number of cations (or anions) resulting from the dissociation of one molecule of the salt, appears in the formula for calculations of the solubility product as the exponent of the concentration of the cation (or anion).

If two solutions, each containing one of the ions of a difficultly soluble salt, are mixed, no precipitation takes place unless the product of the ion concentrations in the mixture is greater than the solubility product.

In a solution containing two salts which yield a common ion the ratio of solubilities of the two salts is the ratio of the solubility products.

Substance	Solubility product at temperature noted	Substance	Solubility product at temperature noted
Aluminum hydroxide	4×10^{-13} (15°)	Calcium oxalate, $CaC_2O_4.H_2O$	1.78×10^{-9} (18°)

[3] 21.49 per cent sulfur.
[4] 65.36 per cent iodine.

PROPERTIES OF THE AMINO ACIDS

Compiled by M. S. Dunn

Dissociation Constants and pH Values at the Isoelectric Points of the Amino Acids at 25°

Interpretation of Data in the Tables

Electrometric titration data and ionic concentration values were used in calculating the classical constants, K_a and K_b. In the few instances where ionic activities were used in place of concentrations the constants varied inappreciably from the values listed.

pH values at the isoelectric points were calculated from the general expression,

$$pI = p\sqrt{\frac{\Sigma K_a}{\Sigma K_b} \times K_w},$$

which may be used in its simplified form, $pI = \frac{1}{2}(pK_a + pK_w - pK_b)$, in the following cases: monoamino monocarboxylic acids; monoamino dicarboxylic acids, where the second acid constant may be neglected; and diamino monocarboxylic acids, where the second base constant may be neglected.

No K_b values for amino acids in formaldehyde solution are listed since they are practically the same as those in water.

Amino acid	Aqueous solution				16 % formaldehyde	
	K_a	K_b	pI	Ref. no.	K_a	Ref. no.
α-Alanine	2.1×10^{-10}	2.2×10^{-12}	6.0	1	4.0×10^{-7}	12

Ni	Ni^{++}	$\frac{1}{2}Ni = \frac{1}{2}Ni^{++} + e$	0.231
Sn	Sn^{++}	$\frac{1}{2}Sn = \frac{1}{2}Sn^{++} + e$	0.136
Pb	Pb^{++}	$\frac{1}{2}Pb = \frac{1}{2}Pb^{++} + e$	0.122
*Fe	Fe^{+++}	$\frac{1}{3}Fe = \frac{1}{3}Fe^{+++} + e$	0.045
H_2	H^+	$\frac{1}{2}H_2 = H^+ + e$	0.0000
*Sb	Sb^{+++}	$\frac{1}{3}Sb = \frac{1}{3}Sb^{+++} + e$	−0.10
*Bi	Bi^{+++}	$\frac{1}{3}Bi = \frac{1}{3}Bi^{+++} + e$	−0.226
*As	As^{+++}	$\frac{1}{3}As = \frac{1}{3}As^{+++} + e$	−0.30
Cu	Cu^{++}	$\frac{1}{2}Cu = \frac{1}{2}Cu^{++} + e$	−0.344
*O_2	OH^-	$OH^- = \frac{1}{4}O_2 + \frac{1}{2}H_2O + e$	−0.397
Po (18°C)	Po^{++++}	$\frac{1}{4}Po = \frac{1}{4}Po^{++++} + e$	−0.40
Cu	Cu^+	$Cu = Cu^+ + e$	−0.470
I_2	I^-	$I^- = \frac{1}{2}I_2 + e$	−0.5345
*Te	Te^{++++}	$\frac{1}{4}Te = \frac{1}{4}Te^{++++} + e$	−0.558
Ag	Ag^+	$Ag = Ag^+ + e$	−0.7978
Hg	Hg^{++}	$2Hg = Hg_2^{++} + 2e$	−0.7986
*Pb	Pb^{++++}	$\frac{1}{4}Pb = \frac{1}{4}Pb^{++++} + e$	−0.80
*Pd	Pd^{++}	$\frac{1}{2}Pd = \frac{1}{2}Pd^{++} + e$	−0.820
*Pt	Pt^{++++}	$\frac{1}{4}Pt = \frac{1}{4}Pt^{++++} + e$	−0.863
Br_2	Br^-	$Br^- = \frac{1}{2}Br_2 + e$	−1.0648
Cl_2	Cl^-	$Cl^- = \frac{1}{2}Cl_2 + e$	−1.3583
*Au	Au^{+++}	$\frac{1}{3}Au = \frac{1}{3}Au^{+++} + e$	−1.360
*Au	Au^+	$Au = Au^+ + e$	−1.50
*F_2	F^-	$F^- = \frac{1}{2}F_2 + e$	−1.90

* These values are doubtful but they indicate the relative activity of the elements and are therefore included.

1. **Action of Metals on Salts.**—Any metal will replace any other metal *below* it in the series thus:

$$Mg + FeSO_4 \rightarrow MgSO_4 + Fe$$
$$Zn + CuSO_4 \rightarrow ZnSO_4 + Cu$$
$$Sn + 2AgNO_3 \rightarrow Sn(NO_3)_2 + 2Ag$$
$$Cu + Hg(NO_3)_2 \rightarrow Cu(NO_3)_2 + Hg$$

This is the fundamental principle of the Daniell Cell. The voltage of such a cell depends upon the difference between the electrode potentials of the metals employed. Thus the Zn-Cu couple gives a greater E.F.M. than the Zn-Pb couple or the Fe-Cu couple.

ELECTROMOTIVE FORCE SERIES OF ELEMENTS (Continued)

2. **Action of Metals on Acids.**—Metals *above* H_2 react with HCl and dilute H_2SO_4, replacing the H_2

$$Zn + \text{dil. } H_2SO_4 \rightarrow ZnSO_4 + H_2$$
$$Sn + 2HCl \rightarrow SnCl_2 + H_2$$
$$Cu + \text{dil. } H_2SO_4 \rightarrow \text{no reaction}$$

Metals above Pt react with HNO_3 and *hot conc.* H_2SO_4

$$2Ag + 2 \text{ conc. } H_2SO_4 \rightarrow Ag_2SO_4 + SO_2 + 2H_2O$$
$$3Zn + 8 \text{ conc. } HNO_3 \rightarrow 3Zn(NO_3)_2 + 2NO + 4H_2O$$
$$3Cu + 8 \text{ dil. } HNO_3 \rightarrow 3Cu(NO_3)_2 + 2NO + 4H_2O$$

The acid first oxidizes the metal and the reaction may be explained as follows:

Some of the acid takes on water and ionizes thus:

$$2HNO_3 + 4H_2O \rightleftarrows 10OH^- + 2N^{+++++}$$

Nitrogen gains 3 electrons and copper loses 2 electrons:

$$2(N^{+++++} + 3e) + 3(Cu - 2e) \rightarrow 3Cu^{++} + 2N^{++}$$

Some of the acid ionizes as follows:

$$6HNO_3 \leftrightarrows 6H^+ + 6NO_3^-$$
$$3Cu^{++} + 6NO_3^- \rightarrow 3Cu(NO_3)_2$$
$$10OH^- + 6H^+ + 2N^{++} \rightarrow 2NO + 8H_2O$$

added $\quad 3Cu + 8HNO_3 \rightarrow 3Cu(NO_3)_2 + 2NO + 4H_2O$

3. **In Regard to Ease of Reduction of Oxides.**—The metallic oxides down to and including Mn can not be completely reduced to the metal state, even in a current of hydrogen. The oxides of Cd and succeeding metals are easily reduced, and far down the list, the oxides of silver, platinum, mercury, and gold are reduced (decomposed into metal and oxygen) even by heat alone.

4. **In Regard to Ease of Rusting. (Oxidation in the Air.)**—The alkali and alkaline-earth metals rust very rapidly and with considerable evolution of heat. All the metals down to copper rust with comparative ease. The metals below copper do not rust. Assuming the electrolytic theory of the process of rusting to be true, these facts are just about what might have been predicted.

5. **In Regard to the Occurrence of the Metals in the Free State in Nature.**—Natural waters are frequently dilute solutions of carbonic, nitric, humic, etc., acids. As such they contain displaceable hydrogen. Metals *above* hydrogen in the E.M.F. series scarcely, if ever, occur in the free state in nature, but are practically without exception found in the combined state, as sulfides, carbonates, etc. Metals *below* hydrogen are frequently found in the free state in nature. Thus gold is found in the form of nuggets of metallic gold. However, metals below hydrogen are also found in the combined state, as cinnabar, HgS, etc.

6. **In Regard to Action of the Metals on Water.**—The alkali and alkaline-earths metal displace hydrogen from water, even in the cold, and with evolution of much heat. Mg and succeeding metals will displace hydrogen from steam. Metals at the bottom of the list will not displace hydrogen from steam.

7. **In Regard to the Solubility and Stability of Hydroxides.**—The alkali metal oxides have great avidity for water, forming hydroxides. The alkaline-earth metal oxides react with less readiness, forming hydroxides. MgO reacts slowly and incompletely with water, forming the hydroxide. All the other metallic oxides and hydroxides are insoluble in water and have no perceptible reaction therewith. When a solution of NaOH acts on solutions of salts of the metals, the alkali metal salts are not precipitated. The alkaline-earth metal salts are not precipitated unless in very concentrated solution. All the other metal solutions are acted upon, with precipitation of hydroxides, except in the case of copper which first gives copper hydroxide (blue), and which, on warming, changes to copper oxide (black). Also in the case of arsenic, no precipitate falls, sodium arsenite being formed. In the case of the last metals in the series, the *oxide* is precipitated, instead of the hydroxide, thus NaOH acting on salts of Sb, Hg, Ag, Pd, Pt, and Au, causes a precipitation of the *oxides* of these metals. Bismuth, as an exception, gives a normal hydroxide.

ELECTROMOTIVE FORCE SERIES OF ELEMENTS (Continued)

8. **In Regard to Carbonates.**—The alkali metals form normal stable, soluble carbonates, not easily decomposed on heating. The alkaline-earth metals form normal carbonates, which are insoluble in water, and which decompose upon heating, leaving the oxide, carbon dioxide being evolved. When sodium carbonate solution acts on solutions of all the other metals, as a rule, a basic carbonate is precipitated, being insoluble in water, and decomposed by heat into oxide and carbon dioxide. If the solution is cold, Ag, Hg, Cd, Fe, and Mn give normal carbonates. If the solution is warm, Sb, Hg, Ag, Pd, Pt, and Au give a precipitate of the *oxide*, instead of the carbonate, thus showing the instability of the carbonates of the lowest metals in the series.

9. **In Regard to Nitrates.**—The nitrates of the alkali metals decompose when strongly heated forming the *nitrite* and oxygen. The nitrates of the heavy metals, down to and including copper, decompose when heated forming the oxide of the metal, oxygen and nitrogen dioxide. Mercury nitrate when heated yields mercury, oxygen and nitrogen dioxide.

REDUCTION VALUES FOR GLUCOSE IN BLOOD

Amounts of Glucose Corresponding to Titration Values when 0.1 c.c. Blood is Used in the Method of Hagedorn and Jensen. Biochem. Zeit. 135, 46; 137, 92 (1923).

Procedure

Into a test tube (15 × 150 mm.) pipette 1 c.c. 0.1 normal NaOH and 5 c.c. 0.45% zinc sulfate solution; 0.1 c.c. of blood from a capillary pipette is added being washed out with the mixture in the test tube; heat for 3 minutes in a boiling water bath; filter through cotton into a test tube (30 × 90 mm.) and wash the filter with two 3 c.c. portions of water. Add 2 c.c. of alkaline ferricyanide solution (1.65 g potassium ferricyanide, 10.6 g anhydrous sodium carbonate in 1000 c.c. of water) and heat in a boiling water bath for 15 minutes; cool and add 3 c.c. of the iodide-sulfate solution (5 g potassium iodide, 10 g zinc sulfate, 50 g sodium chloride and sufficient water to make 200 c.c.) and 2 c.c. of 3% acetic acid solution. Titrate with 0.005 normal sodium thiosulfate using starch indicator. The method is based upon the reduction of alkaline ferricyanide by glucose and the subsequent titration of the excess unreduced ferricyanide according to the following equation: $2H_3Fe(CN)_6 + 2HI = 2H_4Fe(CN)_6 + I_2$

Amounts of Glucose Corresponding to Titration Values when 5 c.c. of 1:10 Blood Filtrate and 5 c.c. of Copper Reagent (Modified*) are Heated in a Water Bath for 15 Minutes. M. Somogyi, Jour. Biol. Chem. 70, 599 (1926).

To 5 c.c. of the copper reagent in a test tube (250 × 25 mm) are added 5 c.c. of the sugar solution containing between 0.1 and 2.0 mg of glucose; mix; heat for 15 minutes in a boiling water bath; cool to 35°C; with mixing add 1 c.c. of 5N H_2SO_4 and 2 minutes later titrate with 0.005 normal $Na_2S_2O_3$. A blank titration using 5 c.c. of water in place of the blood is run at the same time.

Amounts of Glucose Corresponding to Titration Values when 2 c.c. of 1:15 Blood Filtrate and 2 c.c. of Copper Reagent (Modified*) are Heated in a Water Bath for 15 Minutes. M. Somogyi, Jour. Biol. Chem. 70, 599 (1926).

Milligrams of Glucose in 100 c.c. of Blood

To 2 c.c. of 0.0667 normal H_2SO_4 in a test tube add 0.2 c.c. of blood, rinsing the pipette several times with the liquid in the test tube; add exactly 0.2 c.c. of 2.5% sodium tungstate solution; centrifugate; fasten a small tuft of absorbent cotton over the end of a 2 c.c. pipette and with this pipette remove 2 c.c. of the blood filtrate in the test tube and deliver it into a 16 × 150 mm. test tube; add exactly 2 c.c. of the sugar-copper reagent; mix; heat in a boiling water bath for 15 minutes; cool to 35°C.; add 1 c.c. 2 normal H_2SO_4 and titrate with 0.005 normal $Na_2S_2O_3$. A blank using 0.2 c.c. of water in place of the blood is run at the same time.

* Modified tartrate-carbonate copper reagent. — Copper sulfate (crystalline) 6.5 g; rochelle salt 12 g; sodium carbonate (anhydrous) 20 g; potassium iodide 10 g; potassium iodate 0.8 g; potassium oxalate 18 g; sodium bicarbonate 25 g; water sufficient to make one liter of solution.

CUPROUS OXIDE EQUIVALENT OF DEXTROSE, INVERT SUGAR, LACTOSE AND MALTOSE

(Munson and Walker, Jour. Amer. Chem. Soc. 28, 663 (1906.)

Add exactly 25 c.c. of Fehling Solution A and 25 c.c. of Fehling Solution B (see under *Special Solutions and Reagents*) to 50 c.c. of reducing sugar solution (if a smaller volume of sugar solution is used, add sufficient water to make the final solution 100 c.c.); heat the solution at such a rate that boiling begins in four minutes and continue boiling for exactly 2 minutes, keeping the beaker covered with a watch glass; filter immediately on a Gooch crucible using suction; wash thoroughly with water at 60°C., then with 10 c c. of alcohol and finally with 10 c.c. of ether; dry for 30 minutes in an oven at 100°C., cool in a desiccator and weigh as cuprous oxide.

(Expressed in Milligrams)

Cuprous Oxide Cu_2O	Dextrose $C_6H_{12}O_6$	Invert Sugar	Lactose $C_{12}H_{22}O_{11}$	Maltose $C_{12}H_{22}O_{11}$	Cuprous Oxide Cu_2O	Dextrose $C_6H_{12}O_6$	Invert Sugar	Lactose $C_{12}H_{22}O_{11}$	Maltose $C_{12}H_{22}O_{11}$

GRAVIMETRIC FACTORS AND THEIR LOGARITHMS

Computed from the International atomic weights of 1933 by Eric A. Arnold and Howard E. Thompson.

To facilitate the use of the table the group of substances weighed given under each element as well as the substances sought under each substance weighed are arranged in the alphabetical order of their formulae.

Weighed	Sought	Factor	Logarithm
Aluminum $Al = 26.97$			—10

HEAT OF FORMATION AND SOLUTION

The following table gives the heat of formation of compounds from the elements in their standard states (18° C, 1 atm.) and the heat of solution in water in kilogram calories (mean) per gram-formula weight. To convert to B.T.U. multiply by 3.9685. To convert to kilojoules multiply by 4.186.

Values given are for 18° C and 1 atm. unless otherwise indicated. The heat of solution is given in most cases for a definite number of water molecules to one of the substance. Where this is not stated the dilution is understood to be such that additional dilution produces a negligible thermal effect.

The symbol ∞ indicates that the substance is formed in an "infinite" amount of water.

HEAT OF COMBUSTION

For Organic Compounds

The heat of combustion is given in kilogram calories per gram molecular weight of the substance when combustion takes place at atmospheric pressure and 20° C. The final products of combustion are gaseous carbon dioxide, liquid water and nitrogen gas for C, H, N compounds. For method of computing heats of formation see statement following this table.

Selections from a compilation by Kharasch, Bureau of Standards Journal of Research **2,** 359 (1929).

Name	Formula	Physical state	Heat of combustion, kg. calories
Acetaldehyde	CH_3CHO	liquid	279.0
Acetamide	CH_3CONH_2	solid	282.6
Acetanilide	$CH_3CONHC_6H_5$	solid	1,010.4
Acetic acid	CH_3CO_2H	liquid	209.4
Acetic anhydride	$(CH_3CO)_2O$	liquid	431.9
Acetone	$(CH_3)_2CO$	liquid	426.8
Acetonitrile	CH_3CN	liquid	302.4
Acetophenone	$C_6H_5COCH_3$	solid	988.9
Acetylacetone	$CH_3COCH_2COCH_3$	liquid	615.9
Acetylene	$(CH)_2$	gas	312.0
Acrolein	$CH_2:CHCHO$	liquid	389.6
Acrylic acid	$CH_2:CHCO_2H$	liquid	327.5
Adipic acid	$(CH_2)_4(CO_2H)_2$	solid	669.0
Alanine	$CH_3CH(NH_2)CO_2H$	solid	387.7
Aldol, *see β-hydroxybutyr-aldehyde*			
Alizarin, *see Dihydroxyanthraquinone*			
Allyl alcohol	$CH_2:CHCH_2OH$	liquid	442.4
Allylene	$CH_3C:CH$	gas	465.1
p-Aminoazobenzene	$H_2NC_6H_4N_2C_6H_5$	solid	1,574.0
p-Aminophenol	$HOC_6H_4NH_2$	solid	760.0
Amygdalin	$C_{20}H_{27}O_{11}N$	solid	2,348.4
Amyl acetate	$C_4H_9CO_2C_2H_5$	liquid	1,042.5
Amyl alcohol (ferm.)	$(CH_3)_2CH_2CH_2CH_2OH$	liquid	793.7
Amylene	C_5H_{10}	liquid	803.4
Anethole	$C_{10}H_{12}O$	solid	1,324.4
Aniline	$C_6H_5NH_2$	liquid	811.7
p-Anisidine	$CH_3OC_6H_4NH_2$	solid	924.0
Anisole	$C_6H_5OCH_3$	liquid	905.1
Anthracene	$C_6H_4:(CH)_2:C_6H_4$	solid	1,700.4
Anthraquinone	$C_{14}H_8O_2$	solid	1,544.5
Arabinose	$C_5H_{10}O_5$	solid	559.9
Arabitol	$C_5H_{12}O_5$	solid	661.2
Arachidic acid	$C_{20}H_{40}O_2$	solid	3,025.9
Azelaic acid	$(CH_2)_7(CO_2H)_2$	solid	1,141.7
Azobenzene	$(C_6H_5N)_2$	solid	1,545.9
Azoxybenzene	$(C_6H_5N)_2O$	solid	1,534.5
Behenic acid	$C_{22}H_{44}O_2$	solid	3,338.4
Benzalacetone	$C_6H_5CH:CHCOCH_3$	solid	1,257.4
Benzaldehyde	C_6H_5CHO	liquid	841.3
Benzamide	$C_6H_5CONH_2$	solid	847.6
Benzanilide	$C_6H_5CONHC_6H_5$	solid	1,575.5
Benzene	C_6H_6	liquid	782.3
Benzenediazonium nitrate	$C_6H_5N_2NO_3$	solid	782.6
Benzidine	$(C_6H_4NH_2)_2$	solid	1,560.9
Benzil	$(C_6H_5CO)_2$	solid	1,624.6
* Benzoic acid	$C_6H_5CO_2H$	solid	771.2
Benzoic anhydride	$(C_6H_5CO)_2O$	solid	1,555.1
Benzoin	$C_6H_5.CHOH.COC_6H_5$	solid	1,671.4
Benzonitrile	C_6H_5CN	liquid	865.5
Benzophenone	$(C_6H_5)_2CO$	solid	1,556.5

* Accepted value by Int. Union of Pure and Appld. Chem., Lyons, 1922

HEAT OF COMBUSTION (Continued)

HEAT OF FORMATION

For Organic Compounds

The heat of formation of a compound "A" is equal to the sum of the heats of formation of the products of combustion minus the heat of combustion (see preceding table) of the compound "A." The heat of formation of:

Free elements	0	kg-cal
CO_2 (gas)	94.38	"
$\frac{1}{2}H_2O$ (liquid from 1 H)	34.19	"
HF (dilute aqueous solution)	75.6	"
SO_2 (gas)	69.3	"
HBr (aqueous solution)	28.54	"
HCl (aqueous solution)	39.46	"
HNO_3 (aqueous solution)	49.80	"
H_2SO_4 (aqueous solution)	207.5	"

Example I

To calculate the heat of formation of methane (CH_4) where

Heat of combustion of methane = 210.8
Heat of formation of CO_2 = 94.38
Heat of formation of $\frac{1}{2}H_2O$ = 34.19

and where the combustion occurs according to the equation:

$$CH_4 + 2O_2 = CO_2 \text{ (gas)} + 2H_2O \text{ (liquid)}$$

Then the heat of formation of $CH_4 = 94.38 + 4(34.19) - 210.8 = +20.34$ kg-cal. per gram molecular weight.

Example II

To calculate the heat of formation of ethylene (C_2H_4) where

Heat of combustion of ethylene = 331.6

and the combustion occurs according to the equation:

$$C_2H_4 + 3O_2 = 2CO_2 + 2H_2O$$

The heat of formation of $C_2H_4 = 2(94.38) + 4(34.19) - 331.6 = -6.08$ kg-cal. per gram molecular weight.

Example III

To calculate the heat of formation of ethylamine ($C_2H_5NH_2$) where

Heat of combustion of ethylamine = 408.5

and the combustion occurs according to the equation:

$$C_2H_5NH_2 + 3.75O_2 = 2CO_2 + 3.5(H_2O) + N_2$$

The heat of formation of $C_2H_5NH_2 = 2(94.38) + 7(34.19) + O(N_2) - 331.6 = +96.49$ kg-cal. per gram molecular weight.

COMBUSTION CONSTANTS OF GASES

The flue products are based upon air with 21% oxygen and 79% nitrogen; flame temperatures are not corrected for dissociation; the high or gross heat value is one which would be obtained by burning in a Junker's calorimeter; it includes the heat of condensation of the water formed by combustion and assumes that all products of combustion are cooled to the initial temperature; the low or net heat value assumes that all of the products of combustion except water have been cooled to the initial temperature; the difference between the gross and the net is equal to the heat of vaporization of water at the initial temperature.

	Formula	Mol. wt.	Sp. gr. air 1	Wt. per cu. ft. dry	B.t.u. per mol. high (gross)	B.t.u. per mol. low (net)	B.t.u. per cu. ft. high (gross) 60° F. 30 in. satd. H_2O

HEATS OF COMBUSTION AND COMPOSITION OF MANUFACTURED AND NATURAL GASES

Products of combustion, theoretical flame temperatures, air required and B.T.U. of gas-air mixture are based upon air with 21 % oxygen and 79 % nitrogen; heat values are calculated from the table as given under "Combustion Constants of Gases;" flame temperatures are not corrected for dissociation; carburetted water gas, coal gas, coke-oven gases and oil gas contain a small amount of benzene and oxygen.

	Combustion Values								Composition								
	Theoretical flame temp. ° F.	B.T.U. per cu. ft., high (gross) 60° F., 30 in. Hg, satd. H_2O	B.T.U. per cu. ft., low (net) 60° F., 30 in. Hg, satd. H_2O	Cu. ft. air required per cu. ft. gas	Cu. ft. TABLES SHOWING THE FUNCTIONS, USES AND COMPOSITIONS OF FOODS

Functions and Uses of Food in the Body.

Protein. — Builds and repairs tissue Albumen (white of eggs) Casein (curd of milk) Lean meat Gluten of grains **Fats.** — Are stored as fat: Fat of meats, butter, olive oil, oils of corn, wheat and other grains. **Carbohydrates.** — Are transformed into fat: Sugar, starch, etc.	All serve as fuel to yield energy in the forms of heat and muscular power.

Mineral Matter of Ash. — Shares in forming bones and assists in processes of digestion.

Phosphates of lime, potash, soda, etc.

Food is that which, taken into the body, builds tissue and yields energy.

TABLES SHOWING THE FUNCTIONS, USES AND COMPOSITIONS OF FOOD (Continued)

Dietary Standards

For a man in full vigor at moderate muscular work, per day

	Protein	Energy
	Grams	Large calories
Food eaten	100	3500
Food digested	95	3200

Mineral Matter (Required per Day)

	grams
Phosphoric acid, (P_2O_5)	3 to 4
Sulphuric acid, (SO_3)	2 to 3.5
Potassium oxide, (K_2O)	2 to 3
Sodium oxide, (Na_2O)	4 to 6
Calcium oxide, (CaO)	0.7 to 1.0
Magnesium oxide, (MgO)	0.3 to 0.5
Iron, (Fe)	0.006 to 0.012
Chlorine, (Cl)	6 to 8

These tables are compiled from charts of the United States Department of Agriculture, prepared by C. F. Langworthy, expert in charge of nutrition investigations.

Name of the food material	Protein.	Fat.	Carbohydrates.	Ash.	Water.	Fuel value lg. calories per lb.
Apple	0.4	0.5	14.2	0.3	84.6	290
Bacon	9.4	67.4	....	4.4	18.8	3030
Beef suet	4.7	81.8	....	0.3	13.2	3510
Butter	1.0	85.0	....	3.0	11.0	3410
Buckwheat	10.0	2.2	73.2	2.0	12.6	1600
Beefsteak	18.6	18.5	....	1.0	61.9	1130
Buttermilk	3.0	0.5	4.8	0.7	91.0	160
Bean, fresh shelled	9.4	0.6	29.1	2.0	58.9	740
Bean, green string	2.3	0.3	7.4	0.8	89.2	195
Bean, navy dry	22.5	1.8	59.6	3.5	12.6	1600
Banana	1.3	0.6	22.0	0.8	75.3	460
Codfish, fresh	12.8	0.4	....	1.2	82.6	325
Codfish, salt	21.5	0.3	....	24.7	53.5	410
Corn, dried	10.0	4.3	73.4	1.5	10.8	1800
Corn, green	3.1	1.1	19.7	0.7	75.4	500
Corn bread	7.9	4.7	46.3	2.2	38.9	1205
Cream cheese	25.9	33.7	2.4	3.8	34.2	1950
Cottage cheese	20.9	1.0	4.3	1.8	72.0	510
Cream	2.5	18.5	4.5	0.5	74.0	865

TABLES SHOWING THE FUNCTIONS, USES AND COMPOSITIONS OF FOODS (Continued)

NAME OF THE FOOD MATERIAL	PROTEIN	FAT	CARBO-HYDRATES	ASH	WATER	FUEL VALUE IN CALORIES PER LB.
Candy stick			96.5	0.5	3.0	1785
Celery	1.1		3.4	1.0	94.5	85
Chestnut	10.7	7.0	74.2	2.2	5.9	1875
Cocoanut, dried	6.3	57.4	31.5	1.3	3.5	3125
Dried beef	30.0	6.6		9.1	54.3	840
Egg, whole	14.8	10.5		1.0	73.7	700
Egg, white	13.0	0.2		0.6	86.2	265
Egg, yolk	16.1	33.3		1.1	49.5	1608
Fig, dried	4.3	0.3	74.2	2.4	18.8	1475
Fruit, canned	1.1	0.1	21.1	0.5	77.2	415
Grapes	1.3	1.6	19.2	0.5	77.4	450
Grape juice, unfermented	0.2		7.4	0.2	92.2	150
Herring, smoked	36.4	15.8		13.2	34.6	1355
Honey	0.4		81.2	0.2	18.2	1520
Jelly, fruit			78.3	0.7	21.0	1455
Lard		100.0				4080
Lamb chop	17.6	28.3		1.0	53.1	1540
Mackerel	18.3	7.1		1.2	73.4	645
Macaroni	3.0	1.5	15.8	1.3	78.4	415
Milk, whole	3.3	4.0	5.0	0.7	87.0	310
Milk, skimmed	3.4	0.3	5.1	0.7	90.5	165
Molasses	2.4		69.3	3.2	25.1	1290
Oat	11.8	5.0	69.2	3.0	11.0	1720
Olive oil		100.0				4080
Oyster	6.2	1.2	3.7	2.0	86.9	235
Onion	1.6	0.3	9.9	0.6	87.6	225
Pork chop	16.9	30.1		1.0	52.0	1580
Parsnip	1.6	0.5	13.5	1.4	83.0	230
Potato	2.2	0.1	18.4	1.0	78.3	385
Peanut	25.8	38.6	22.4	2.0	9.2	2500
Peanut butter	29.3	46.5	17.1	5.0	2.1	2825
Rye	12.2	1.5	73.9	1.9	10.5	1750
Rice	8.0	2.0	77.0	1.0	12.0	1720
Rolled oats, cooked	2.8	0.5	11.5	0.7	84.5	285
Raisins	2.6	3.3	76.1	3.4	14.6	1605
Smoked ham	16.1	38.8		4.8	40.3	1940
Sugar, granulated			100.0			1860
Sugar, maple			82.8	0.9	16.3	1540
Strawberry	1.0	0.6	7.4	0.6	90.4	180
Toasted bread	11.5	1.6	61.2	1.7	24.0	1420

$ZnSO_4.7H_2O$	25	$ZnSO_4.6H_2O$	White
$ZnSO_4.6H_2O$	28	$ZnSO_4.2H_2O$	White
$ZnSO_4.2H_2O$	115	$ZnSO_4.H_2O$	White
$ZnSO_4.H_2O$	225	$ZnSO_4$	White
$MnSO_4.5H_2O$	25	$MnSO_4.2H_2O$	Pale peach blossom
$MnSO_4.2H_2O$	60	$MnSO_4.H_2O$	Paler than above
$MnSO_4.H_2O$	152	$MnSO_4$	Paler than above
$CuSO_4.5H_2O$	27	$CuSO_4.3H_2O$	Blue
$CuSO_4.3H_2O$	93	$CuSO_4.H_2O$	Pale blue
$CuSO_4.H_2O$	155	$CuSO_4$	White
$Al_2(SO_4)_3.16H_2O$	51	$Al_2(SO_4)_3.13H_2O$	White
$Al_2(SO_4)_3.13H_2O$	82	$Al_2(SO_4)_3.10H_2O$	White
$Al_2(SO_4)_3.10H_2O$	97	$Al_2(SO_4)_3.7H_2O$	White
$Al_2(SO_4)_3.7H_2O$	109	$Al_2(SO_4)_3.4H_2O$	White
$Al_2(SO_4)_3.4H_2O$	180	$Al_2(SO_4)_3.H_2O$	White
$Al_2(SO_4)_3.H_2O$	316	$Al_2(SO_4)_3$	White
$FeSO_4.7H_2O$	21	$FeSO_4.4H_2O$	Light apple green
$FeSO_4.4H_2O$	80	$FeSO_4.H_2O$	White
$FeSO_4.H_2O$	406	Fe_2O_3, SO_3	Yellowish green

DECOMPOSITION OF ANHYDROUS METALLIC SULPHATES

Metallic sulphate.	Temp. at beginning of decomposition, ° C.	Temp. of energetic decomposition, ° C.	Products of decomposition.	Color of product.
$FeSO_4$	167	480	Fe_2O_3, $2SO_4$	Yellow brown
Fe_2O_3, $2SO_3$	492	560	Fe_2O_3	Red
$Bi_2(SO_4)_3$	570	639	$5Bi_2O_3$, $4(SO_3)_3$	White
$Al_2(SO_4)_3$	590	639	Al_2O_3	White
$PbSO_4$	637	705	$6PbO$, $5SO_3$	White
$CuSO_4$	653	670	$2CuO$, SO_3	Orange
$MnSO_4$	699	790	Mn_3O_4	Dark red to black
$ZnSO_4$	702	720	$3ZnO$, $2SO_3$	White
$2CuO$, SO_3	702	736	CuO	Black
$NiSO_4$	703	764	NiO	Brownish green
$CoSO_4$	720	770	CoO	Brown to black
$3ZnO$, $2SO_3$	755	767	ZnO	White
$CdSO_4$	827	846	$5CdO$, SO_3	White
$5Bi_2O_3$, $4(SO_3)_3$	870	890	Bi_2O_3(?)	Yellow
$5CdO$, SO_3	878	890	CdO	Brown
$MgSO_4$	890	972	MgO	White
Ag_2SO_4	917	925	Ag	Silver white
$6PbO$, $5SO_3$	952	962	$2PbO$, SO_3(?)	White to yellow
$CaSO_4$	1200	....	CaO	White
$BaSO_4$	1516	....	BaO	White

SPECIFIC GRAVITY OF AQUEOUS SOLUTIONS

The following collections of tables gives the specific gravity, grams per liter, pounds per cubic foot, and pounds per gallon for a large number of substances in aqueous solution. The three latter quantities have been computed from the per cent of the substance in solution and the specific gravity, assuming the density of water at 4° C. as unity. The U. S. gallon, cubic foot, and pound avoirdupois equivalents were used. The degree Baumé corresponding to the specific gravity is given according to the relation,

$$\text{Bé.} = 145 - \frac{145}{\text{Sp. Gr.}}.$$

The per cent by weight is indicated in every case.

The substances are arranged in alphabetical order. The specific gravity of alcohol solutions will be found in a separate group. Another table gives, with less detail, the specific gravity of solutions of many other substances.

Tables indicated by the symbol * have been computed on the basis of values for the specific gravity found in the International Critical Tables.

ACETIC ACID

Specific Gravity of Aqueous Acetic Acid Solutions at $\frac{20°}{4°}$ C.*

AQUA AMMONIA

Authority — W. C. Ferguson

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = \frac{140}{\text{Sp. Gr.}} - 130.$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

The coefficient of expansion for Ammonia Solutions varying with the temperature, correction must be applied according to the following table:

	Corrections to be added for each degree below 60° F.		Corrections to be subtracted for each degree above 60° F.			
Degrees Baumé	40° F.	50° F.	70° F.	80° F.	90° F.	100° F.

HYDROCHLORIC ACID

Authority — W. C. Ferguson

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}$$

Baumé Hydrometers for use with this table must be graduated by the above formula which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

10° – 15° Bé. — 1/40° Bé. or .0002 Sp. Gr. for 1° F.
15° – 22° Bé. — 1/30° Bé. or .0003 " " " 1° F.
22° – 25° Bé. — 1/28° Bé. or .00035 " " " 1° F.

NITRIC ACID

Authority — W. C. Ferguson

This table has been approved and adopted as a Standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities, the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}.$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should *always* be printed on the scale.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

Allowance for Temperature

At 10°–20° Bé. — 1/30° Bé. or .00029 Sp. Gr. = 1° F.
20°–30° Bé. — 1/23° Bé. or .00044 " " = 1° F.
30°–40° Bé. — 1/20° Bé. or .00060 " " = 1° F.
40°–48.5° Bé. — 1/17° Bé. or .00084 " " = 1° F.

TABLES OF THE MANUFACTURING CHEMISTS' ASSOCIATION

SULFURIC ACID

Authorities — W. C. Ferguson; H. P. Talbot

This table has been approved and adopted as a standard by the Manufacturing Chemists' Association of the United States.

Specific Gravity determinations were made at 60° F., compared with water at 60° F.

From the Specific Gravities the corresponding degrees Baumé were calculated by the following formula:

$$\text{Baumé} = 145 - \frac{145}{\text{Sp. Gr.}}.$$

Baumé Hydrometers for use with this table must be graduated by the above formula, which formula should always be printed on the scale.

66° Baumé = Sp. Gr. 1.8354.

1 cu. ft. water at 60° F. weighs 62.37 lbs. av.

Atomic weights from F. W. Clarke's table of 1901. O = 16.

H_2SO_4 = 100 per cent.

	H_2SO_4	O. V.	60°
O. V.	93.19	100.00	119.98
60°	77.67	83.35	100.00
50°	62.18	66.72	80.06

Acids stronger than 66° Bé. should have their percentage compositions determined by chemical analysis.

ETHYL ALCOHOL

Specific Gravity of Mixtures of Ethyl Alcohol and Water by Volume and by Weight

Giving the specific gravity at 15.56° C. referred to water at the same temperature. To reduce to specific gravity referred to water at 4° C. multiply by 0.99908.
(U. S. Department of Agriculture.)

Specific gravity.	Per cent alcohol by volume.	Per cent alcohol by weight.	Grams alcohol per 100 c.c.	Specific gravity.	Per cent alcohol by volume.	Per cent alcohol by weight.	Grams alcohol per 100 c.c.

Calculation of the percentage of ethyl and methyl alcohols in a mixture with water, assuming a distillate to have a sp. gr. of 0.97917 $\frac{15.56°}{15.56°}$ and a refraction of 30.0 at 20° on the immersion refractometer. — From the tables of sp. gr. for these alcohols the density is found to correspond to 13.70% and 12.83% by weight of ethyl and methyl alcohol respectively; from the table above, the refractometer readings corresponding to 13.70% ethyl and methyl alcohol are 38.16 and 22.42 respectively. Then $(38.16 - 30.0) / (38.16 - 22.42) \times 100 = 51.8\%$, or 51.8% of the alcohol in the distillate is methyl alcohol.

$(12.83 \times 0.518) + 13.70 \times (1 - 0.518) = 13.25$ which is the % by weight of the mixed alcohols in the distillate, of which 13.25×0.518 or 6.86% is methyl alcohol and $13.25 \times (1 - 0.518)$ or 6.39% is ethyl alcohol.

Wood's metal....	50 Bi, 25 Pb, 12.5 Cd, 12.5 Sn	10.56	659.23

DENSITY OF VARIOUS SOLIDS

The approximate density of various solids at ordinary atmospheric temperature.

(Selected principally from the Smithsonian Tables.)

Substance.	Grams per cu. cm.	Pounds per cu. ft.
Agate	2.5–2.7	156–168
Alabaster, carbonate	2.69–2.78	168–173
sulphate	2.26–2.32	141–245
Albite	2.62–2.65	163–165
Amber	1.06–1.11	66–69
Amphoboles	2.9–3.2	180–200
Anorthite	2.74–2.76	171–172
Asbestos	2.0–2.8	125–175
Asphalt	1.1–1.5	69–94
Basalt	2.4–3.1	150–190
Beeswax	0.96–0.97	60–61
Beryl	2.69–2.7	168
Biotite	2.7–3.1	170–190
Bone	1.7–2.0	106–125
Brick	1.4–2.2	87–137
Butter	0.86–0.87	53–54
Calamine	4.1–4.5	255–280
Calcspar	2.6–2.8	162–175
Caoutchouc	0.92–0.99	57–62
Celluloid	1.4	87
Cement, set	2.7–3.0	170–190
Chalk	1.9–2.8	118–175
Charcoal, oak	0.57	35
pine	0.28–0.44	18–28
Cinnabar	8.12	507
Clay	1.8–2.6	122–162
Coal, anthracite	1.4–1.8	87–112
bituminous	1.2–1.5	75–94
Cocoa butter	0.89–0.91	56–57
Coke	1.0–1.7	62–105
Copal	1.04–1.14	65–71
Cork	0.22–0.26	14–16
Corundum	3.9–4.0	245–250
Diamond	3.01–3.52	188–220
Dolomite	2.84	177
Ebonite	1.15	72
Emery	4.0	250
Epidote	3.25–3.50	203–218
Feldspar	2.55–2.75	159–172
Flint	2.63	164
Fluorite	3.18	198
Galena	7.3–7.6	460–470
Gamboge	1.2	75
Garnet	3.15–4.3	197–268
Gas carbon	1.88	117
Gelatine	1.27	80
Glass, common	2.4–2.8	150–175
flint	2.9–5.9	180–370
Glue	1.27	80
Granite	2.64–2.76	165–172
Graphite	2.30–2.72	144–170
Gum arabic	1.3–1.4	80–85
Gypsum	2.31–2.33	144–145
Hematite	4.9–5.3	306–330
Hornblende	3.0	187

DENSITY OF WATER

The temperature of maximum density for pure water, free from air = **3°.98** C.

The density at this temperature = **0.999973** g/cm³.
The density of water at 3.98° C is 1.000000 g/ml.

(International Bureau of Weights and Measures, 1910.)

HYDROMETERS AND DENSITY UNITS

Alcoholometer. — For testing alcoholic solutions; the scale shows the per cent of alcohol by volume; 0°–100° is the per cent.

Ammoniameter. — For testing ammonia solutions; scale 0°–40°; to convert to sp. gr. multiply by 3 and deduct from 1000.

Barktrometer or *Barkometer.* — For testing tanning liquor; scale 0°–80° Bk; the number to the right of the decimal point of the sp. gr. is the degree Bk; thus, 1.025 sp. gr. is 25° Bk.

Baumé. — There are two kinds in use; heavy Bé, for liquids heavier than water and light Bé for liquids lighter than water. In the former, 0° corresponds to a sp. gr. 1.000 (water at 4°C.) and 66° corresponds to a sp. gr. 1.842; in the lighter than water scale, 0° Bé is equivalent to the gravity of a 10% solution of sodium chloride and 60° Bé corresponds to a sp. gr. of 0.745. For Baumé degrees on the scale of densities greater than unity, the following equation gives the means of conversion:

$$\text{Sp. gr.} = \frac{m}{m - d} \quad \text{where } \begin{aligned} m &= 145 \text{ (in the United States)} \\ m &= 144 \text{ (old scale used in Holland)} \\ m &= 146.78 \text{ (New scale or Gerlach scale)} \\ d &= \text{Baumé reading} \end{aligned}$$

Beck's Hydrometer has 0° corresponding to sp. gr. 1.000 and 30° to sp. gr. 0.850; equal divisions on the scale are continued as far as required in both directions.

Brix Saccharometer or *Balling Saccharometer* shows directly the per cent of sugar (sucrose) by weight at the temperature indicated on the instrument, usually 17.5°C.; i.e., degrees Brix is the per cent sugar.

Cartier's Hydrometer floats in water at the 10° scale division and at 30° corresponds to 32° Bé.

Oleometer. — For vegetable and sperm oils; scale 50°–0° corresponds to sp. gr. 0.870–0.970.

Soxhlet's Lactometer, for determining the density of milk, has a scale from 25° (sp. gr. 1.025) to 35° (sp. gr. 1.035) divided into suitable scale divisions.

Twaddell Hydrometers have the scale so arranged that the reading multiplied by 5 and added to 1000 gives the sp. gr. with reference to water as 1000; it is always used for densities greater than water.

RELATIVE DENSITY AND VOLUME OF WATER

The mass of one cubic centimeter of water at 4° C is taken as unity.
The values given are numerically equal to the absolute density in grams per milliliter.

(Smithsonian Tables, compiled from Various Authors.)

DENSITY OF MOIST AIR

The density of dry air may be determined by computation from the general relation $D = D_0(T_0/T)(P/P_0)$ where D_0 represents a known density at absolute temperature T_0 and pressure P_0 and D, the density at absolute temperature T and pressure P.

The density of **moist** air may be determined by a similar relation: $D = 1.2929\ (273.13/T)\ [(B - 0.3783e)/760]$ where T is the absolute temperature; B, the barometric pressure in mm, and e the vapor pressure of the moisture in the air in mm. The density will then be the product of two terms, each of which may be found by use of the tables which follow.

The **first factor,** $1.2929\ (273.13/T)$, may be found directly in Table I for various temperatures. For convenience, temperatures are given in the table in °C although the values of the factor have been computed with absolute temperatures. The tabular values actually represent the density of dry air at various temperatures and 760 mm pressure.

The **second factor,** $[(B - 0.3783e)/760]$, must be obtained in two steps: **First**—the numerator of the expression is obtained by subtracting $0.3783e$ from the barometric pressure. The quantity $0.3783e$ may be found directly from the dew point in Table II. If the wet and dry bulb thermometer readings are known e may be found in the table Reduction of Psychrometric Observations given in the section Hygrometric and Barometric Tables. $0.3783e$ may then be found by calculation or read from the table. **Second**—the value of the whole factor for any value of $B - 0.3783e$ may be obtained from Table III.

The product of the above two factors will give the required density in g/l.

To facilitate obtaining **approximate values** of the density for ordinary pressures and temperatures, a table of products is given which may be entered with the temperature in °C and the corrected (for moisture) value of the barometric pressure in mm to obtain density.

As an illustration of the use of the tables, let it be desired to find the density of air for a barometric pressure of 750 mm, a dew point of 10° C, and air temperature of 20° C.

From the dew point, the value of $0.3783e$ is found in Table II to be 3.48 mm. $750 - 3.48 = 746.52$, the corrected pressure. The pressure factor for this value found in Table III by interpolation is 0.98226.

The temperature factor from Table I is 1.2047.

$$1.2047 \times 0.98224 = 1.1833 \text{ g/l.}$$

To obtain the value directly from Table IV, enter it for 20° C and 746.5 mm which gives by interpolation 1.183 g/l.

TABLE I

$(1.2929 \times 273.13/T)$

(Besides being a necessary part of the determination of the density of moist air, the values in this table are actually the density of dry air in g/l at 760 mm pressure for various temperatures.)

TABLE III

Pressure Factor.—[(*B* − 0.3783*e*)/760]

The figures in the body of the table give values of the whole term $(B - 0.3783e)/760$] for various values of the numerator $(B - 0.3783e)$ expressed at the left and top.

TABLE IV

Density of Moist Air

Values in the body of the table give the density of moist air in g/l for a limited range of temperatures and corrected pressure values ($B - 0.3783e$) The latter may be obtained by use of Table II.

°C	600	610	620	630	640	650	660	670	680	690

ELASTIC CONSTANTS FOR SOLIDS

The following table gives values for the yield point (or elastic limit, indicated by e.), ultimate tensile strength Young's modulus and the modulus of rigidity in kg/mm². The Brinell hardness number is also given, representing the ratio of load in kilograms on a sphere used to indent material to the spherical area of the indentation in square millimeters.

YIELD POINT, TENSILE STRENGTH, BRINELL HARDNESS

Material	Yield point Kg/mm²	Yield point Lbs./in.²	Ultimate tensile strength Kg/mm²	Ultimate tensile strength Lbs./in.²	Brinell hardness number
		×10³		×10³

ELASTIC CONSTANTS FOR GASES

For short ranges of pressure, at a constant temperature, the volume of a gas is inversely proportional to the pressure or pressure $\times$volume = a constant. (Boyle's Law.)

For high pressures, the table below shows the relative volumes at various temperatures. The volume at 0° C. and 76 cm. pressure (1 atmosphere) being taken as 1,000,000.

(From Smithsonian Tables.)

COEFFICIENT OF FRICTION

(From Rankine's Compilation, 1858; Smithsonian Tables.)

Materials.	Coefficient of friction.	Angle of repose in degrees.
Wood on wood, dry	.25–.50	14.0–26.5
Wood on wood, soapy	.20	11.5
Metals on oak, dry	.50–.60	26.5–31.0
Metals on oak, wet	.24–.26	13.5–14.5
Metals on oak, soapy	.20	11.5
Metals on elm, dry	.20–.25	11.5–14.0
Hemp on oak, dry	.53	28.0
Hemp on oak, wet	.33	18.5
Leather on oak	.27–.38	15.0–19.5
Leather on metals, dry	.56	29.5
Leather on metals, wet	.36	20.0
Leather on metals, greasy	.23	13.0
Leather on metals, oily	.15	8.5
Metals on metals, dry	.15–.20	8.5–11.5
Metals on metals, wet	.3	16.5
Smooth surfaces occasionally greased	.07–.08	4.0–4.5
Smooth surfaces continually greased	.05	3.0
Smooth surfaces, best results	.03–.036	1.75–2.0
Steel on agate, dry	.20	11.5
Steel on agate, oiled	.107	6.1
Iron on stone	.30–.70	16.7–35.0
Wood on stone	about .40	22.0
Masonry and brick work, dry	.60–.70	33.0–35.0
Masonry and brick work, damp mortar	.74	36.5
Masonry on dry clay	.51	27.0
Masonry on moist clay	.33	18.25
Earth on earth	.25–1.00	14.0–45.0
Earth on earth, dry sand, clay and mixed earth	.38–.75	21.0–37.0
Earth on earth, damp clay	1.00	45.0
Earth on earth, wet clay	.31	17.0
Earth on earth, shingle and gravel	.81–1.11	39.0–48.0

RESISTANCE TO CRUSHING FOR VARIOUS MATERIALS

Approximate values in pounds per square inch.

Material.	Resistance to crushing in lbs. per sq. in.	Material.	Resistance to crushing in lbs. per sq.in.
Brick:		Granite	9700–34000
soft burned	3000–6000	Limestone	6000–25000
hard burned	4500–6500	Marble	7600–20700

Brownstone	7300–23600	Tufa	7700–11600
Concrete	800–3800		

TENSILE STRENGTH OF METALS

(Selected from Smithsonian Tables.)

Given in pounds per square inch. The values can be considered only as approximations.

Metal.	Tensile Strength in lbs. per sq. in.
Aluminum wire	30000–40000
Brass wire	50000–150000
Bronze wire, phosphor, hard drawn	110000–140000
Bronze wire, silicon, hard drawn	95000–115000
Bronze	60000–75000
Cobalt, cast	33000
Copper wire, hard drawn	60000–70000
German silver	40000–50000
Gold wire	20000
Iron, cast	13000–33000
Iron wire, hard drawn	80000–120000
Iron wire, annealed	50000–60000
Lead, cast or drawn	2600–3300
Magnesium, hard drawn	33000
Monel metal, cold drawn	80000–100000
Nickel, hard drawn	155000
Palladium	39000
Platinum wire	50000
Silver wire	42000
Steel	80000–330000
Steel wire, maximum	460000
Steel, specially treated nickel steel	250000
Steel, piano wire, 0.033 in. diam	357000–390000
Steel, piano wire, 0.051 in. diam	325000–337000
Tantalum	130000
Tin, cast or drawn	4000–5000
Tungsten, hard drawn	590000
Zinc, cast	7000–13000
Zinc, drawn	22000–30000

MODULUS OF RUPTURE. TRANSVERSE TESTS FOR VARIOUS WOODS

(Smithsonian Tables.)

SURFACE TENSION

Compiled by T. Fraser Young and William D. Harkins

Meaning of Symbols

γ = the surface tension in dynes per centimeter.

$\Delta\gamma$ = the surface tension of a solution minus the surface tension of the pure solvent.

-- air, means that the liquid was in contact with air (saturated with its own vapor).

-- vapor, means that the liquid was in contact with its own vapor.

-- N_2 and -- H_2 have corresponding meanings.

-- also designates the surface between a pair of liquids at which the interfacial tension was determined.

% = weight % of the solute (i. e. the organic substance).

f = gram formula weights per 1000 grams of solvent (i. e. water).

°C = degrees Centigrade.

°K = degrees Kelvin or Absolute. Temperature in °C = Temperature in °K − 273.1.

M.P., at the melting point.

k_E = the Eötvös Constant, in erg mole $^{-\frac{2}{3}}$ degree $^{-1}$.

$$-k_E = \frac{d\,\Gamma}{d\,t} = \frac{d\,(M/d)^{\frac{2}{3}}\,\gamma}{d\,t}$$

where $\Gamma = \gamma\,(M/d)^{\frac{2}{3}}$

M = mass of one gram formula weight of the substance

d = density of the substance.

AQUEOUS SOLUTIONS AGAINST AIR

INORGANIC

(f = gram formula weights per 1000 grams of solvent.)

For the following aqueous solutions the values of $\Delta\gamma$ are given. $\Delta\gamma$ is the difference between the surface tension of the solution and that of the solvent at the same temperature. Positive values of $\Delta\gamma$ mean that the surface tension of the solution is greater than that of the solvent. Negative values, the reverse. For convenience in computing the surface tension, the current accepted value for the surface tension of water at the stated temperature is given in the second column.

Formula	°C (γH_2O)		$\Delta\gamma$ for concentrations indicated							
$CaCl_2$	25	f	.1	.5	1.0	2.0	3.0	5.0	11.2

VISCOSITY

The coefficient of viscosity of a substance is defined as the tangential force per unit area of either of two horizontal planes at unit distance apart, one of which is fixed, while the other moves with unit velocity, the space being filled with the substance.

In the case of a liquid flowing slowly through a long tube of small diameter, the volume V of liquid which escapes in a time t is given by the equation,

$$V = \frac{\pi p r^4}{8 l \eta} t$$

where p is the difference in pressure between the two ends of the tube; r, its radius; l, its length and η, the coefficient of viscosity. (Law of Poiseuille.)

A more complete equation is now generally used:

$$\eta = \frac{\pi d g r^4 t}{8Q(l + \lambda)}\left(h - \frac{mv^2}{g}\right)$$

where η is the coefficient of viscosity; d, the density in gm./cm^3; r, the radius and l the length of the tube in cm.; Q, the volume in cm.^{3} discharged in t sec.; λ a correction to the length of the tube; h, the average head in cm.; m, the coefficient of the kinetic energy correction, mv^2/g; g, the acceleration due to gravity in cm./sec.^{2}; v, the mean velocity in cm./sec. See Technologic Papers of the Bureau of Standards 100 and 112, 1917 and 1918 for a full discussion.

The coefficient of viscosity is expressed in dyne-seconds per cm.^{2} or poises.

Specific viscosity is the ratio of the coefficient of viscosity of any substance to that of water at 0° C. or other specified temperature.

More complete data, including the composition of the samples named above, will be found in Scientific Paper No. 393, Bureau of Standards.

EQUATION FOR THE LINEAR EXPANSION OF SOLIDS

If l_0 is the length at 0° C the length at t° C is $l_t = l_0\ (1 + \alpha t + \beta t^2)$.
The table gives the values of these coefficients.

Substance	Temp. limits °C	α	β	Observer
Aluminum	10–90	$.2221 \times 10^{-4}$	$.114 \times 10^{-7}$	Fizeau

Zinc	10–90	.2969	−.0635	Fizeau

CUBICAL EXPANSION OF SOLIDS

The coefficient of cubical expansion for a solid is approximately three times the linear coefficient.

The experimental values for various solids are given in the following table. The coefficient is the increase in volume per unit volume per degree Centigrade.

Substance	Temp. ° C	Coefficient	Observer
Antimony	0–100	0.3167×10^{-4}	Matthiessen

REDUCTION OF GAS VOLUME TO NORMAL CONDITIONS

Factors and their logarithms for reducing a gas volume to normal conditions, 0° C., 760 mm pressure.

The volume of *dry* gas measured at any temperature 10–35° C. inclusive and pressure 690–784 mm of Hg may be reduced to the volume at 0° C. (273.18° K.) and 760 mm of Hg pressure by multiplying by the factor found in the table.

In case the volume of gas is measured in the presence of water vapor the pressure of the aqueous vapor must be subtracted from the value of the total or barometric pressure before entering the table. In the case of atmospheric air the vapor pressure may be found by determining the dew point or temperature of saturation. The pressure of water vapor may then be read from the small table below. If gas volumes are measured over water, the vapor pressure will be that of saturated aqueous vapor at the temperature used. A table giving the pressure of saturated aqueous vapor over water is given below.

Pressure of Saturated Water Vapor

°C.	mm	°C.	mm	°C.	mm
9	8.6	18	15.5	27	26.7

SPECIFIC HEAT OF WATER AND MERCURY

Values for water from 0–100° C are the mean of various determinations including Calendar and Blonsfield, 1912; above 100, Regnault's values recomputed by Guillaume, 1912.

Values for mercury 0–80° C due to Barnes and Cooke; 90–140°, mean of Winkelmann, Naccari and Milthaler; above 140°, mean of Naccari and Milthaler.

Specific heat in normal calories (15° C).

COLOR SCALE OF TEMPERATURE

This table is the result of an effort to interpret in terms of thermometric readings, the common expressions used in describing temperatures. It is obvious that the values are only approximations.

Color.	Temperature, °C.
Incipient red heat	500–550
Dark red heat	650–750
Bright red heat	850–950
Yellowish red heat	1050–1150
Incipient white heat	1250–1350
White heat	1450–1550

SPECIFIC HEAT

Variation with Temperature

The table gives the true specific heat at the temperatures named. From data of Wüst, Meuthen, and Durrer, 1918.

°C	Pb	Zn	Al	Ag	Au	Cu	Ni	Fe	Co	Quartz

* The data in this table are compiled from various sources,— hence the variations in the melting point of the metals as shown in this column.

MELTING AND BOILING TEMPERATURES

Temperature of Fusion for Various Substances for Atmospheric Pressure

For the melting- and boiling-points of the chemical elements and of inorganic compounds see under Physical Constants of the Elements, and Physical Constants of Inorganic Compounds.

Substance.	Temp. of fusion ° C.	Substance.	Temp. of fusion ° C.
Acetylene	−81	German silver	1000.
Alcohol, ethyl	−130.	Glass	1100.
Brass	900.	Glycerine	17.
Butter	31–31.5	Olive oil	2–6
Camphor	177.7	Paraffin	55.
Caoutchouc, pure gum	120.	Resin	135.
Chloroform	−63.2	Sea water	−2.5
Ether	−117.6	Sugar (cane)	160.

Boiling-point for Various Substances

Giving the boiling-point at atmospheric pressure and the variation per cm. pressure near 76 cm.

Substance.	Temp. ° C.	Variation.
Acetone	57.	0.39
Acetylene	−72.2	
Alcohol, ethyl	78.3	0.34
methyl	64.7	0.35
Amyl acetate	148.	
Benzene	80.	0.43
Camphor	205.	0.56
Chloroform	61.2	0.41
Ether	34.6	0.40
Gasoline	70–90.	
Glycerine	291.	—
Turpentine	159.	

MELTING POINT OF ICE—VARIATION WITH PRESSURE

(From Tamann, 1900, by permission.)

Pressure in kg. per sq.cm.	Temp. ° C.	Pressure in kg. per sq.cm.	Temp. ° C.
1	0.0	1410	−12.5
336	− 2.5	1625	−15.0
615	− 5.0	1835	−17.5
890	− 7.5	2042	−20.0
1155	−10.0	2200	−22.1

BOILING POINTS OF WATER-ALCOHOL MIXTURES

(P. N. Evans, Journal of Industrial and Engineering Chemistry.)

Boiling point, ° C.	Weight per cent alcohol in		Boiling point, ° C.	Weight per cent alcohol in	
	Liquid.	Vapor.		Liquid.	Vapor.
78.2	91	92	86.5	18	71

86.0	20	72	100.0	0	0

MOLECULAR ELEVATION OF THE BOILING POINT

Showing the elevation of the boiling point due to the addition of one gram molecular weight of the dissolved substance, for various solvents.

Solvent	Constant for one gram molecular weight dissolved in 100 gms. ° C.	Constant for one gram molecular weight dissolved in 100 c.c. at the boiling point. ° C.
Acetic acid	25.4–30.7	....
Acetone	16.7	22.2
Aniline	32.2–34.1	....
Benzene	26.7	32.0
Chloroform	36.6	26.0
Ether	21.1	30.3
Ethyl acetate	27.9	....
Ethyl alcohol	11.5	15.6
Methyl acetate	20.6	....
Methyl alcohol	8.4–9.3	....
Nitrobenzene	50.1–50.4	....
Phenol	30.4	....
Water	5.2	5.4

MOLECULAR DEPRESSION OF THE FREEZING POINT

Showing the depression of the freezing point due to the addition of one gram molecular weight of dissolved substance, for various solvents.

Solvent	Depression for one gram molecular weight dissolved in 100 gms. ° C.
Acetic acid	39.0
Benzene	49.0
Benzophenone	98.0
Diphenyl	80.0
Diphenylamine	86.0
Ethylene dibromide	118.0
Formic acid	27.7
Naphthalene	68–69
Nitrobenzene	70.0
Phenol	74.0
Stearic acid	45.0
Triphenyl methane	124.5
Urethane	51.4
Water	18.5–18.7

LOWERING OF FREEZING POINT FOR AQUEOUS SOLUTIONS

The concentration of the solutions is expressed as the number of gram formula weights per 1,000 grams of water. The table gives the molal lowering of freezing point in °C for the concentration stated.

CORRECTION OF BOILING POINTS TO STANDARD PRESSURE

By H. B. Hass and R. F. Newton

This correction may be made by using the equation:

$$\Delta t = \frac{(273.1 + t)(2.8808 - \log p)}{\phi + .15(2.8808 - \log p)} \quad (1,$$

where Δt = degrees C to be added to the observed boiling point.
t = the observed boiling point.
$\log p$ = the logarithm of the observed pressure in millimeters of mercury.
ϕ = the entropy of vaporization at 760 mm.

The value of ϕ may be estimated from the graph and the table. Substances not included in the table may be classified by grouping them with compounds which bear a close physical or structural resemblance to them.

Example 1. Benzene boils at 20°C. at 75 mm pressure. What is its normal boiling point? We do not find benzene in the table but we find hydrocarbons in group 2, and a group 2 compound with a boiling point of 20° has a ϕ of 4.6.

Substituting in the equation:

$$\Delta t = \frac{(273.1 + 20)(2.8808 - 1.8751)}{4.60 + .15(2.8808 - 1.8751)} = 62°$$

Adding this to 20° gives 82° as a first approximation.

The graph shows that the ϕ for a compound of group 1 boiling at 82° is 4.72 instead of 4.60 which we originally used. Since ϕ is in the denominator, this increase will lower our Δt by the ratio, $\frac{4.60}{4.72}$, or the corrected Δt is $62 \times \frac{4.60}{4.72} = 60.4$. Adding Δt to t, gives 80.4° as a second approximation.

The formula can best be used in a slightly different form when the reverse calculation is desired, *i.e.*, when one calculates the vapor pressure at a given temperature, lower than the normal boiling point.

$$2.8808 - \log p = \frac{\phi \Delta t}{273.1 + t - .15\Delta t} \quad (2)$$

Example 2. Alcohol boils at 78.4°C. What is its vapor pressure at 20°C.? Substituting in equation 2:

$$2.8808 - \log p = \frac{6.06 \times 58.4}{293.1 - (.15 \times 58.4)} = 1.245$$

$$\log p = 2.8808 - 1.245 = 1.6358$$

$$p = 43.2 \text{ mm.}$$

Here no second approximation is necessary, since the correct value of ϕ was taken immediately, the normal boiling point having been known.

FREEZING MIXTURES

A is the proportion of the substance named in the first column to be added to the proportion of the substance given in column *B*. The table gives the temperature of the separate ingredients and the temperature attained by the mixture.

(From Smithsonian Tables.)

Substance.	*A*	*B*	Initial Temp. ° C.	Temp. ° C. attained by mixt.

n-Valeronitrile	C_4H_9CN	129	96.3

CHANGE IN VOLUME DUE TO FUSION

The table gives the variation in volume expressed in c.cm. for one gram of the substance.

Substance.	Variation, cm.	Observer.
Aluminum.....	+0.019	Toepler, 1894
Bismuth.......	−0.0034	Toepler, 1894
Cadmium.....	+0.0064	Toepler, 1894
Iron..........	−0.0085	Wrightson, Roberts, 1881
Lead..........	+0.0034	Toepler, 1894
Tin...........	+0.0039	Toepler, 1894
Water.........	−0.083*	Toepler, 1894
Zinc..........	+0.0105	Toepler, 1894

*For one cubic centimeter.

FIXED TEMPERATURE FOR THERMOMETER CALIBRATION

Corrections for pressure are indicated by equations in which p indicates pressure in millimeters of mercury. and t the boiling point at normal pressure.

Points designated by an asterisk (*) are suggested by E. F. Mueller as base points to be used in defining a Standard Working Scale.

Substance	Point	Temperature thermodynamic scale °C	Condition or correction
Hydrogen..............	Boiling	−252.75	$+0.0044\ (p-760)$
Nitrogen..............	Vapor pressure	−195.80	$+0.0109\ (p-760)$
Liquid O_2*...........	Vapor pressure	−183.00	$+0.0126\ (p-760)$ $-0.0000065\ (p-760)^2$
Isopentane............	Freezing	−159.6	
Methylcyclohexane....	Freezing	−126.3	
Ether................	Rapid freezing or slow melting	−116.3	
Carbon disulfide.......	Freezing	−111.6	
Toluene..............	Freezing	− 95.1	
Ethyl acetate.........	Freezing	− 83.6	
Solid CO_2*...........	Vapor pressure	− 78.51	$+0.01595\ (p-760)$ $-0.000011\ (p-760)^2$
Chloroform...........	Freezing	− 63.5	
Chlorobenzene........	Freezing	− 45.2	
Mercury*.............	Freezing	− 38.87	
Carbon tetrachloride...	Freezing	− 22.9	
Ice*.................	Melting	0.000	
Sodium sulfate........	Transition	32.384	
Ethyl alcohol.........	Boiling	78.26	76 cm. variation 0.34° per cm.
Benzene..............	Boiling	80.0	76 cm. variation 0.43° per cm.

FIXED TEMPERATURE FOR THERMOMETER CALIBRATION (Continued)

Substance	Point	Temperature thermo-dynamic scale °C	Condition or correction
Water*	Boiling	100.000	$+0.0367\ (p-760)-0.000023\ (p-760)^2$
Chlorobenzene	Boiling	132.	76 cm. variation 0.50° per cm.
Xylene (m.)	Boiling	138.8	76 cm. variation 0.50° per cm.
Aniline	Boiling	184.51	76 cm. variation 0.51° per cm.
Toluidine (o.)	Boiling	199.7	76 cm. variation 0.58° per cm.
Naphthalene	Condensing	217.96	$+0.2075\ (t+273.1)\ \log_{10}\ (p/760)$
Tin	Freezing	231.85	
Diphenylamine	Boiling	302.	
Benzophenone	Condensing	305.9	$+0.194\ (t+273.1)\ \log_{10}\ (p/760)$
Cadmium	Freezing	320.9	
Lead	Freezing	327.4	
Mercury	Boiling	356.9	
Potassium dichromate	Melting	397.5	
Zinc	Freezing	419.45	
Sulfur*	Condensing	444.60	$+0.0909\ (p-760)-0.000048\ (p-760)^2$
Potassium sulfate	Inversion	583.0	
Antimony*	Freezing	630.5	Approx. To be determined with resistance thermometer.
30.5 NaCl+69.5 Na_2SO_4	Melting	637.0	
Aluminum (99.85%)	Freezing	658.9	
Potassium chloride	Melting	770.3	
Sodium chloride	Melting	800.4	
Sodium sulfate	Melting	884.7	
Silver*	Freezing	960.5	(reducing atmosphere)
Gold*	Freezing	1063.	
Potassium sulfate	Melting	1069.1	
Copper	Freezing	1083.	(reducing armosphere)
Lithium metasilicate	Melting	1202.	
Diopside	Melting	1395.	
Nickel	Melting or freezing	1452.	
Palladium	Freezing	1555. ±2	
Anorthite	Melting	1555.	
Platinum	Melting	1755. ±6	
Alumina	Melting	2000.	
Tungsten	Melting	3370. ±30	

PRESSURE OF AQUEOUS VAPOR

Vapor Pressure of Ice

Pressure of aqueous vapor over ice in mm of Hg for temperatures from −98 to 0°C.

VAPOR PRESSURE OF MERCURY

Vapor pressure of mercury in mm. of Hg for temperatures from −38 to 400°C. Note that the values for the first four lines only, are to be multiplied by 10^{-6}.

Temp. °C	0	2	4	6	8
	10^{-6}	10^{-6}	10^{-6}	10^{-6}	10^{-6}

* Undercooled liquid.
Critical temperature = 31.0°C. Triple point, −56.602 ± 0.005°C; 3885.2 ± 0.4 mm.

VAPOR PRESSURE

Pressure and Density (or Specific Volume) of Saturated Vapor

Pressure of the saturated vapor is given in millimeters of mercury or in atmospheres as indicated; the density of the liquid and saturated vapor in g/cm³, and the specific volume in cm³/g. The temperatures are stated in degrees Centigrade. The normal boiling point is the temperature for which the pressure is 1 atm. or 760 mm. Data refers to the liquid state unless otherwise indicated.

The following abbreviations are used: b.p., boiling point; c.p., critical point; liq., liquid; m.p., melting point: sol., solid; t.p., triple point.

VAPOR PRESSURE

Variation with Temperature

The following table gives the value of the constants a and b in the following equation:

$$\log_{10} p = -\frac{0.05223a}{T} + b$$

where p is the pressure in mm of mercury of the saturated vapor at the absolute temperature T. ($T = t°C + 273.1$).

Elements and Inorganic Compounds

Compound	Formula	Temp. range °C	a	b
Aluminum oxide	Al_2O_3	1840 to 2200 liq.	540,000	14.22
Ammonia	NH_3	−127 to −78 sol.	31,211	9.9974
Ammonium bromide	NH_4Br	250 to 400 sol.	90,208	9.9404
Ammonium chloride	NH_4Cl	100 to 400 sol.	83,486	10.0164
Ammonium cyanide	NH_4CN	7 to 17 sol.	41,484	9.978
Ammonium iodide	NH_4I	300 to 400 sol.	95,730	10.2700
Ammonium sulfhydrate	NH_4HS	6 to 40 sol.	46,025	10.7500
Antimony	Sb	1070 to 1325 liq.	189,000	9.051
Argon	A	−208 to −189 sol.	7,814.5	7.5741
		−189 to −183 liq.	6,826.0	6.9605
Arsenic	As	800 to 860 liq.	47,100	6.692
		440 to 815 sol.	133,000	10.800
Arsenous oxide	As_2O_3	100 to 310 sol.	111,350	12.127
		315 to 490 liq.	52,120	6.513
Barium	Ba	930 to 1130 liq.	350,000	15.765
Bismuth	Bi	1210 to 1420 liq.	200,000	8.876
Bismuth trichloride	$BiCl_3$	91 to 213 sol.	13,125	2.681
Cadmium	Cd	150 to 320.9 sol.	109,000	8.564
		500 to 840 liq.	99,900	7.897
Cadmium iodide	CdI_2	385 to 450 liq.	122,200	9.269
Caesium	Cs	200 to 350 liq.	73,400	6.949
Caesium chloride	CsCl	986 to 1295 liq.	163,200	8.340

VAPOR PRESSURE (Continued)

Compound	Formula	Temp. range °C	a	b
Calcium	Ca	960 to 1110 liq.	370,000	16.240
Carbon	C	3880 to 4430 liq.	540,000*	9.596*
Carbon dioxide	CO_2	−135 to −56.7 sol.	26,179.3	9.9082
Carbon monoxide	CO	−290 to −206 liq.	6,354	6.976
Chlorine	Cl	−154 to −103 sol.	29,293	9.950
Cobalt	Co	2375 liq.	309,000	7.571
Copper	Cu	2100 to 2310 liq.	468,000	12.344
Cuprous chloride	Cu_2Cl_2	878 to 1369 liq.	80,700	5.454
Cyanogen	$(CN)_2$	−72 to −28 sol.	32,437	9.6539

Toluene	C_7H_8	−92 to +15 liq.	39,198	8.330

LOWERING OF VAPOR PRESSURE BY SALTS IN AQUEOUS SOLUTIONS

The table gives the reduction of the vapor pressure in millimeters due to the presence of the number of grammolecules of salt per liter of water given at the head of the columns, at the temperature 100° C., at which temperature the vapor pressure of pure water is 76.0 centimeters.

(From Smithsonian Tables.)

NUMBER OF MOLECULES IN A GRAM-MOLECULE

Perrin, 1909–11 .... 6.2×10^{23}
Perrin (Brownian movement) 6.85
Millikan, 1910 .... 6.2
Millikan, 1917 .... 6.06

MASS OF THE HYDROGEN ATOM

1.66×10^{-24} grams

HEAT CONDUCTIVITY

Giving the quantity of heat in calories which is transmitted per second through a plate one centimeter thick across an area of one square centimeter when the temperature difference is one degree Centigrade.

THERMAL CONDUCTIVITY OF MATERIALS

(Bureau of Standards Letter Circular No. 227)

D = Density in pounds per cubic foot.
K = Thermal conductivity in B.T.U. per hour, square foot, and temperature gradient of 1 degree Fahrenheit per inch thickness. The lower the conductivity, the greater the insulating values.

Soft Flexible Materials in Sheet Form

		D	K
Dry Zero	Kapok between burlap or paper	1.0	0.24
		2.0	0.25
Cabots Quilt	Eel grass between kraft paper	3.4	0.25
		4.6	0.26
Hair Felt	Felted cattle hair	11.0	0.26
		13.0	0.26
Balsam Wool	Chemically treated wood fibre	2.2	0.27
Hairinsul	75% hair 25% jute	6.3	0.27
	50% hair 50% jute	6.1	0.26
Linofelt	Flax fibres between paper	4.9	0.28
Thermofelt	Jute and asbestos fibres, felted	10.0	0.37
	Hair and asbestos fibres, felted	7.8	0.28

Loose Materials

		D	K
Rock Wool	Fibrous material made from rock,	6.0	0.26
	also made in sheet form, felted and	10.0	0.27
	confined with wire netting	14.0	0.28
		18.0	0.29
Glass Wool	Pyrex glass, curled	4.0	0.29
		10.0	0.29
Sil-O-Cel	Powdered diatomaceous earth	10.6	0.31
Regranulated Cork	Fine particles	9.4	0.30
	about 3/16 inch particles	8.1	0.31
Thermofill	Gypsum in powdered form	26.	0.52
		34.	0.60
Sawdust	Various	12.0	0.41
	redwood	10.9	0.42
Shavings	Various, from planer	8.8	0.41
Charcoal	From maple, beech and birch,		
	coarse	13.2	0.36
	6 mesh	15.2	0.37
	20 mesh	19.2	0.39

Semi-flexible Materials in Sheet Form

		D	K
Flaxlinum	Flax fibre	13.0	0.31
Fibrofelt	Flax and rye fibre	13.6	0.32

THERMAL CONDUCTIVITY OF MATERIALS (Continued)

Semi-rigid Materials in Board Form

Corkboard	No added binder; very low density	5.4	0.25
Corkboard	No added binder; low density....	7.0	0.27
Corkboard	No added binder; medium density	10.6	0.30
Corkboard	No added binder; high density ..	14.0	0.34
Eureka	Corkboard with asphaltic binder .	14.5	0.32
Rock Cork	Rock wool block with binder..... Also called "Tucork"	16.7	0.37
Lith	Board containing rock wool, flax and straw pulp.................	14.3	0.40

Stiff Fibrous Materials in Sheet Form

Insulite	Wood pulp....................	16.2	0.34
		16.9	0.34
Celotex	Sugar cane fibre...............	13.2	0.34
		14.8	0.34

*Masonite........................	K = 0.33
*Inso-board........................	0.33
*Maizewood........................	0.33 to 0.39
*Cornstalk Pith Board................	0.24 to 0.30
*Maftex........................	0.34

Cellular Gypsum

Insulex or Pyrocell..................	8	0.35
	12	0.44
	18	0.59
	24	0.77
	30	1.00

Woods (Across Grain)

Balsa..............................	7.3	0.33
	8.8	0.38
	20	0.58
Cypress............................	29	0.67
White pine.........................	32	0.78
Mahogany...........................	34	0.90
Virginia pine......................	34	0.98
Oak................................	38	1.02
Maple..............................	44	1.10

Miscellaneous Building Materials

(Data taken from various sources)

	K		K
Cinder concrete....	2 to 3	Limestone..........	4 to 9
Building gypsum....	About 3	Concrete...........	6 to 9
Plaster............	2 to 5	Sandstone..........	8 to 16
Building brick......	3 to 6	Marble............	14 to 20
Glass..............	5 to 6	Granite............	13 to 28

* From various commercial laboratories and the work of O. R. Sweeney at Iowa State College.

TEMPERATURE OF SATURATED STEAM

The following table gives the temperature of saturated water vapor in degrees Centigrade and degrees Fahrenheit corresponding to gauge pressure in pounds from 0 to 3184. Zero gauge pressure corresponds to an absolute pressure of 14.696 pounds per square inch.

Gauge pressure lbs./in.^{2}	Temp. °F	Temp. °C	Gauge pressure lbs./in.^{2}	Temp. °F	Temp. °C	Gauge pressure lbs./in.^{2}	Temp. °F	Temp. °C
0	212.0	100.0	55	302.5	150.3	110	344.1	173.4

PROPERTIES OF SATURATED STEAM

PROPERTIES OF

METRIC AND

The heat units used are the large calorie, 15° to 16° C and the B.T.U., 62° to 63° F. The heat of the liquid, q, is the heat required to raise unit mass of water from 0° C (32° F) to the temperature indicated. The heat of vaporization, r, is the heat required to vaporize unit mass of water at the indicated temperature and pressure. Total heat involved, $H = r + q$.

The heat of vaporization overcomes external pressure and changes the state from liquid to vapor at constant temperature and pressure. If u is the

SATURATED STEAM

English Units

change in volume the external work is pu and the corresponding amount of heat is Apu where A is the reciprocal of the mechanical equivalent of heat. The part of the heat of vaporization not used in external work is considered used in changing the state from liquid to vapor. The heat required for this work may be represented by $\rho = r - Apu$.

(From Peabody, Steam and Entropy Tables, John Wiley and Sons, Inc., publishers, by permission.)

Temperature, degrees Centigrade.	Heat equivalent of external work.		Entropy of the liquid.	Entropy of vaporization.	Specific volume.		Density.		Temperature, degrees Fahrenheit
	Calories per kilogram.	B.T.U. per pound.			Cubic meters per kilo.	Cubic feet per pound.	Kilos per cubic meter.	Pounds per cubic foot.

HIGH AND LOW TEMPERATURES

Absolute zero, −273.18° C.

M.p. of helium	−272.2° C.
B.p. of helium	−268.9
M.p. of hydrogen	−259.18
B.p. of hydrogen	−252.8
B.p. of liquid air	−192

Industrial furnaces	1700° C.
Bunsen burner	1870
Oxy-hydrogen flame	2800
Tungsten tube furnace (Forsythe)	2800
Carbon arc furnace (Forsythe)	3200
Oxy-acetylene flame	3500° C.
Tungsten arc under pressure (Luckey)	4785
Cored carbon arc (Suits)	5500
Iron welding arc (Suits)	6020
Tungsten arc, max. (Suits)	6440
Exploding wires by high voltage discharge (Anderson)	19700

The Sun (Coblentz)	6000° K.
Stars, max. estimated	30000° K.

SCALE OF FUSIBILITY

Number	Mineral	Approximate fusing point	Notes
1	Stibnite	525° C	Fuses easily in a candle flame.
2	Chalcopyrite	800° C	Fuses slowly in a gas flame.
3	Almandite	1050° C	Only finest splinters rounded in a gas flame.
4	Actinolite	1200° C	Standard-size fragments are rounded easily before the blowpipe.
5	Orthoclase	1300° C	Standard-size fragments are rounded with difficulty before the blowpipe.
6	Bronzite	1400° C	Only finest splinters rounded on points with difficulty before the blowpipe.
7	Quartz	>1400° C	Entirely infusible before the blowpipe.

CONSTANT TEMPERATURE BATHS

The following substances may be utilized between the temperatures indicated (boiling points) by using pressures from 10 to 76 cm. The second temperature given is the boiling point at the latter pressure. Several of the liquids are inflammable and must be used with caution.

Substance	Temperature °C
Ethyl chloride	−31.3 to 12.2
Ethyl ether	−12.1 to 34.5
Carbon disulfide	−4.8 to 46.3
Acetone	7.5 to 56.1
Chloroform	9.7 to 61.2
Methyl alcohol	20.62 to 64.5
Ethyl alcohol	34.4 to 78.5
Benzene	25.8 to 79.8
Water	51.7 to 100.
Toluene	51.8 to 110.5
Chlorobenzene	70.3 to 132.1
Isoamyl acetate	142.5
Bromobenzene	90.7 to 156.2
Aniline	119.4 to 184.4
Naphthalene	144.3 to 217.9
Methyl salicylate	151. to 223.3
Isoamyl benzoate	262.
Diphenylamine	221. to 302.0
Benzophenone	224. to 305.4
Mercury	261.5 to 356.9
Sulfur	330.7 to 444.6
Zinc	758. to 907.

TEMPERATURE CORRECTION FOR BAROMETER READINGS

Brass Scale—Metric Units

To reduce readings of a mercurial barometer with a brass scale to 0°C subtract the appropriate quantity as found in the table. These values are based on the coefficient of expansion of mercury $(181792 + 0.175t + 0.035116t^2) \times 10^{-9}$, and of brass 0.0000184 per °C. Corrections are in millimeters.

Standard Temperature of scale 62° F; of mercury, 32° F. Zero correction at 28.5° F; subtract corrections above, add below. Owing to the difference in the standard temperature of English and metric scales, readings taken in inches to be reduced to centimeters should *first* be corrected for temperature.

REDUCTION OF BAROMETER TO SEA LEVEL

The correction to be added to reduce barometric readings to "sea level" values depends principally on three factors: The temperature of the air column (assumed) from the station to sea level, the altitude of the station, and the value of the reading itself. Two tables are provided. Table I is entered with the altitude and assumed temperature and a factor "2000 m" taken out. Table II is entered with the above factor and the approximate barometer reading and the final correction taken out.

The correction is to be added. If B_0 is the corrected or sea level value; B the barometer reading at the station; C the correction,—

$$C = B_0 - B = B\,(10^m - 1)$$

The actual barometer reading at the station should be corrected for temperature of the mercury column by the usual methods before entering the tables or applying the sea level correction.

A complete explanation of the theory of the corrections and a more extended set of tables will be found in the Smithsonian Meteorological Tables.

Latitude Factor

The influence of the latitude on the value of the correction is usually negligible, being overshadowed by uncertainties in the assumed temperature of the air column. For cases where this correction is desirable the table below is provided. The value of the temperature-altitude factor "2000 m" obtained in Table I is corrected for latitude by subtracting for latitudes 0-45° and adding for latitudes from 45-90° the values found. With this corrected value of "2000 m" Table II is entered for the value of the correction.

LATITUDE FACTOR

To be used in connection with Tables I and II, either English or metric units, to obtain latitude corrections to temperature-altitude factor. For latitudes 0-45° subtract the correction. For latitudes 45-90° add the correction.

Temp.—Alt. from Table I	Latitude			
	0°	15°	30°	45°
100	0.3	0.2	0.1	0.0
200	0.5	0.5	0.3	0.0
300	0.8	0.7	0.4	0.0
	90°	75°	60°	45°

REDUCTION OF PSYCHROMETRIC OBSERVATION

For the reduction of observations with the wet and dry bulb thermometer. Assuming the relative velocity of the air to the thermometer bulbs is at least three meters per second; if t is the temperature of the air as indicated by the dry bulb, t_w, the temperature of the wet bulb, B, the barometric pressure, and E_w, the vapor tension of water corresponding to t_w, then the actual vapor tension is

$$E = E_w - 0.00066B(t - t_w)[1 + 0.00115(t - t_w)].$$

The value of the term

$$0.00066B(t - t_w)[1 + 0.00115(t - t_w)]$$

is given in the following table.

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

RELATIVE HUMIDITY

Approximate Relative Humidity from Wet and Dry Thermometer Reading

This table gives the relative humidity direct from the difference between the reading of the dry ($t°$ C.) and the wet ($t_1°$ C.) thermometer. It is computed for a barometer reading of 76 cm. The wet thermometer should be ventilated about 3 meters per second. From Smithsonian Tables

$t°$	Depression of wet-bulb thermometer, $t° - t_1°$

SOUND ABSORPTION

The following tables relating to sound absorption are taken from Bulletin No. 172, Engineering Experiment Station, University of Illinois, by Floyd R. Watson.

Sound Absorbing Coefficients for Pitch 512

Material	Coefficient per sq. ft.
Open window	1.00
Akoustolith (artificial stone)	0.36
Ambler Sound Absorbing Plaster	0.14
Balsam Wool, bare, 1 in. thick, 0.26 lb. per sq. ft.	0.44
Brick wall	0.032
Brick wall, painted	0.017
Brick, set in cement	0.025
Calacoustic Plaster	0.16
Carpet, unlined	0.15
Carpet, lined	0.20
Carpet, with ½ in. Ozite hairfelt	0.25
Carpet rugs	0.20
Acousti-Celotex, type A, unpainted	0.25
Acousti-Celotex, type B, painted or unpainted	0.47
Acousti-Celotex, type BB, painted or unpainted	0.70
Acousti-Celotex, type C, painted or unpainted	0.30
Armstrong Cork Board, 1 in. thick, 0.875 lb. per sq. ft.	0.30
Armstrong Cork Board, sprayed with cold water paint	0.30
Armstrong Cork Board, 2 in. thick, 1.6 lb. per sq. ft.	0.35
Cork tile	0.03
Curtains in heavy folds	0.40–0.75
Fibroblock, unpainted	0.42
Flaxlinum, bare, 1 in. thick	0.61
Flaxlinum, 1 in. thick, with unpainted membrane	0.61
Gimco Rock Wool, bare	0.57
Glass, (single thickness)	0.027

SOUND ABSORPTION (Continued)

Sound Absorbing Coefficients for Pitch 512

Material	Coefficient per sq. ft.
Hairfelt, bare, 1 in. thick, 0.75 lb. per sq. ft.	0.58
Linoleum	0.03
Marble	0.01
Nashkote A, ½ in. thick	0.31
Nashkote A, ¾ in. thick	0.41
Nashkote B, ½ in. thick	0.37
Plaster on wood lath	0.034
Plaster on metal lath	0.033
Plaster on tile	0.025
Sabinite Acoustical Plaster	0.21
Stage opening, depending on stage furnishings	0.25–0.40
Ventilators	0.75
Wood, plain	0.06
Wood, varnished	0.03
Acoustic Zenitherm (cork granules cemented with plaster)	0.33

Individual Objects	Relative coefficient
Adult person	4.7
Plain wood seats	0.15
Church pews, per seat	0.2–0.5
Seats, upholstered seat and back	0.75–2.00
Seat cushions per seat	1.00–2.00

Sound Absorbing Coefficients of Various Materials

Material	Coefficient			
	Pitch = 256*	512	1024	2048
Open window (theoretical value)	1.00	1.00	1.00	1.00
Open window (experimental value)	0.945	0.98	1.08	0.985
Hairfelt, bare, 1 inch thick, 0.75 lb. per sq. ft.	0.34	0.58	0.80	0.84
Acousti-Celotex, type A, (felted bagasse fibres 13/16 in. thick, 1.11 lb. per sq. ft., perforated with 441 small holes per sq. ft. on back of material)	0.30	0.25	0.21	0.26
Acousti-Celotex, type B, ditto, with perforations exposed on front, painted or unpainted	0.24	0.47	0.49	0.60
Acousti-Celotex, type BB, ditto, 1¼ in. thick, 1.67 lb. per sq. ft. painted or unpainted	0.36	0.70	0.76	0.76
Acousti-Celotex, type C, ⅝ in. thick, 0.48 lb. per sq. ft., completely perforated, painted or unpainted.	0.12	0.30	0.48	0.55
Armstrong Cork Board, 1 in. thick, 0.875 lb. per sq. ft.	0.08	0.30	0.31	0.28
ditto, sprayed with cold water paint	0.07	0.30	0.28	0.29
ditto, 2 in. thick, 1.6 lb. per sq. ft.	0.17	0.35	0.27	0.34
Flaxlinum (felted flax fibres), bare, 1 in. thick, 1.17 lb. per sq. ft.	0.49	0.61	0.67	0.66
Flaxlinum, (ditto), with unpainted decorative membrane (0.1 lb. per sq. ft., mesh 10 to the inch) mounted ¾ in. in front of Flaxlinum	0.30	0.61	0.60	0.55
Gimco Rock Wool (silica fibres, felted between metal lath), 1¼ in. thick, 1.44 lb. per sq. ft.	0.46	0.57	0.56	0.72

* At pitch 256 the reverberation room had a resonance, so that materials capable of vibrating would have a somewhat greater coefficient than if the resonance were absent.

SOUND ABSORPTION (continued)

Sound Absorbing Coefficients for Range of Pitch

Material	Coefficient						Authority
	n = 128	256	512	1024	2048	4096	
Open window (theoretical)	1.00	1.00	1.00	1.00	1.00	1.00	
Acoustic Zenitherm (cork granules cemented into a porous stiff tile 1.14 in. thick, 2.07 lbs. per sq. ft.)	0.03	0.13	0.33	0.42	0.42	0.15	Watson, 1926
Akoustolith Tile (1 in. thick)	0.06	0.12	0.36	0.52	0.52	0.36	W. C. Sabine, 1914
Akoustolith Plaster, ½ in. thick on ¼ in. thick lime mortar	0.21	0.24	0.29	0.33	0.37	0.42	Swan, 1923
Rumford Tile, 1 in. thick	0.09	0.18	0.29	0.34	0.34	0.30	W. C. Sabine. 1914

* Coconut charcoal saturated with the gas named.

DIFFERENCE OF POTENTIAL BETWEEN METALS IN SOLUTIONS OF SALTS

The table gives the difference in potential in hundredths of a volt between zinc in a normal solution of sulphuric acid and the metal named at the head of the columns in the solution named at the side. The signs given refer to the external difference of potential.

(Magnanini.)

Strength of the solution in gramme molecules per liter.	Difference of potential in centivolts.					
	Zinc	Cadmium	Lead	Tin.	Copper.	Silver.
0.5 Sulphuric acid	0.0	36.6	51.3	51.3	100.7	121.3

CONDUCTIVITY OF STANDARD SOLUTIONS

Giving the conductivity in reciprocal ohms (mho) per cm. for NaCl, KCl, H_2SO_4 and $MgSO_4$ for various temperatures. Solutions are as follows:—

H_2SO_4,—maximum conductivity (18° C.); dissolve 378 g. of 97% acid in pure water and dilute to 1 liter. Density at 18° C., 1.223.

$MgSO_4$,—maximum conductivity (18° C.); dissolve in 1 liter of distilled water 552 g. of $MgSO_4 7H_2O$. Density at 18° C., 1.190.

NaCl,—solution saturated at all temperatures given. An excess of NaCl in distilled water, about 450 g. per liter. D = 1.2014 (18° C.).

KCl,—normal solution, 74.59 grams per liter of solution at 18° C. Dissolve 74.555 grams (weighed in air) of KCl and dilute to 1 liter. Density, 1.04492.

RESISTIVITY OF DIELECTRICS

Giving the volume resistivity ρ, the variation of the volume resistivity with temperature, given as the ratio of the value at 20° C. to that at 30° C., and the surface resistivity for various dielectrics. The surface resistivity is the resistance between the opposite edges of a centimeter square. A large part of the data are from Curtis, Bulletin of the Bureau of Standards 1915. Temperatures, unless otherwise stated, are 22° C. The numbers in parentheses refer to the source of information.

RESISTIVITY OF DIELECTRICS (Continued)

Description of Materials

Amberite is made by compressing scrap amber.

Bakelite. A phenol condensation product, with various fillers. The various samples were made as follows:

Number	Percent pure Bakelite	Filler	Phenolic Body	Condensing Agent
1		Paper	Cresols	Ammonia
140	50	Vegetable	Phenol	Caustic soda
150	50	Fiber	"	Ammonia
190	50	"	Cresols	"
5199	50	"	Phenol	"
5200	50	Fiber & clay	"	"
5074	35	Talc	"	Caustic soda
588	100	None	"	
1 Regular	100	None	Cresols	Ammonia

Ceresin is a waxy material refined from the mineral ozokerite, m.p. below 100° C. sp. gr. 0.91–0.97. Condensite is a phenol condensation product.

Hard fiber, soft cotton paper, treated with zinc chloride, dried and pressed.

Galalith is made from the casein of milk.

Kavalier glass is hard combustion tubing having a large potassium and calcium content.

Glyptol is an artificial resin resembling amber.

Gummon, hemit, and tegit are coal tar products.

Halowax, chlorinated naphthalenes.

Moulded mica is ground mica and asbestos with shellac.

Stabalite is a rubber compound.

STANDARD CALIBRATION TABLES FOR THERMOCOUPLES

The following tables which represent the Temperature-E. M. F. functions of various thermocouples should be used with appropriate correction curves if precise results are desired. These curves must be determined for each individual couple by plotting ΔE, the difference between the observed and the standard E. M. F., against the standard E. M. F. at three or more fixed temperature points. The value ΔE as shown by such a correction curve is then subtracted algebraically from the observed E. M. F. to give the true E. M. F. reading.

In the following tables the fixed or "cold junction" is at 0° C.; when the cold junction is not maintained at 0° C. the readings of the E. M. F. must be corrected as follows: $Et = E(_{t-tc}) + Etc$ where $E(_{t-tc})$ is the observed reading, Etc is the E. M. F. for the temperature corresponding to the cold junction temperature as read from the standard table and Et is the E. M. F. produced by the hot junction corrected to the value which would be obtained with the cold junction at 0° C. The temperature corresponding to Et is then obtained by reference to the standard table.

Since the E. M. F.-temperature function is not linear the cold junction should be maintained at a temperature very close to that at which the thermocouple was calibrated. Otherwise considerable error will result despite the above correction.

TEMPERATURE-E. M. F. VALUES FOR PLATINUM-PLATINUM (90%), RHODIUM (10%) THERMO-ELEMENTS

E. M. F. values are in millivolts; temperatures are in degrees centigrade (Computed from values in the International Critical Tables)

THERMOELECTRIC POWER

The table gives the thermoelectric power in microvolts per degree Centigrade difference in temperature when the cold junction is at 0°C.

The values given are with respect to lead except where noted. A is the thermoelectric power at 0°C, B is the coefficient of t in the equation for the thermoelectric power at any temperature t,—

$$Q = A + Bt.$$

The values are regarded as positive if the current flows from the metal listed to the reference metal (usually lead) at the cold junction.

Metal	Microvolts per °C		Temp. range °C

MAGNETIC CONSTANTS OF IRON

Permeability of Transformer Iron

Giving M, the total magneto motive force applied. M/l, the magneto motive force per unit length of iron circuit. B the total induction, B/a the induction per unit cross-section of iron, M/B, the magnetic reluctance of the iron circuit and Bl/Ma, the permeability; showing the typical relations of the magnetic constants for varying field.

(From Smithsonian Tables.)

M.	M/l.	B.	B/a.	Reluctance $M/B=K$.	Permeability $Bl/Ma = \mu$.
20	0.597	218×10^3	1406	0.917×10^{-4}	2360

The same annealed	4.6	5350	600	11000	16800
Electrical iron in sheets annealed	1.30	9400	3270	18200	20500

SATURATION CONSTANTS FOR MAGNETIC SUBSTANCES

Substance.	Field intensity. (For saturation.)	Induced magnetization. (For saturation.)	Substance.	Field intensity. (For saturation.)	Induced magnetization. (For saturation.)
Cobalt	9000	1300	Nickel, hard	8000	400
Iron, wrought	2000	1700	annealed	7000	515
cast	4000	1200	Vicker's steel	15000	1600
Manganese steel	7000	200			

MAGNETIC SUSCEPTIBILITY

The following tables give the specific susceptibility χ for various substances. The relation to volume susceptibility κ is shown by the equation $\chi = \kappa/d$, where d is the density of the substance. Unit of χ, 1×10^{-6} cgs electromagnetic units. Room temperature is to be understood where no other is stated. The values are positive for paramagnetic bodies, negative for diamagnetic.

VARIATION OF RESISTANCE DUE TO A MAGNETIC FIELD

Bismuth

The table shows the proportional values of the resistance for values of the magnetic field from 0 to 35,000 and for different temperatures. The resistance at 0° C. and H =0 is taken as 1.

Proportional values of resistance.

(From Smithsonian Tables.)

Various Metals

The table gives the per cent. change in the resistance due to a field of 10,000 gauss with respect to the value at 0° C. and H =0.

(Grumach.)

Metal.	Per cent. change.	Metal.	Per cent. change.
Cadmium	+0.03	Palladium	+0.001
Cobalt	−0.53	Platinum	+0.0005
Copper	+0.004	Silver	+0.004
Gold	+0.003	Tantalum	+0.0003
Lead	+0.0004	Tin	+0.002
Nickel	−1.4	Zinc	+0.01

INTERNAL RESISTANCE OF VARIOUS VOLTAIC CELLS

The internal resistance is subject to large variations; the values given can be considered only approximate.

Cell.	Resistance, ohms.	Cell.	Resistance, ohms.
Edison-Lalande	0.03	Grove	0.1–0.2
Daniell	0.85	Bunsen	0.1–0.2
Gravity	1–5	Bichromate	0.08–0.40
Silver chloride	4.	Storage	0.004–0.02
Dry cell	0.05–0.10	Clark standard	20–50
Leclanché	0.4–0.2	Weston standard	20–50

HALL EFFECT

If a strip of metal of thickness t, in which a current i is flowing (longitudinally) is subjected to a transverse magnetic field H, a difference of potential E is produced at opposite points at the side of the strip. $E = R \times Hi/t$ where R is a constant specific with different metals and E, H, i and t in C. G. S. units. The table gives values obtained at ordinary room temperatures, 18–24° C. If the value of R is independent of the field, or nearly so, the field intensity is not given. The positive sign indicates that if a strip of metal were considered to be in the plane of this page with its long axis horizontal, the primary current flowing from left to right and the magnetic field directed away from the observer, normal to the plane of the strip, the upper edge of the strip would be at a higher potential than the lower.

RADIATIONS

α-RAYS

The α-rays are thought to be positively charged particles, moving with a high velocity. They are only slightly deviable by a strong magnetic or electric field and have small penetrating power. The initial velocity has been found to be about 2×10^9 cm/s. The mass of each particle is 6.2×10^{-24} g (Rutherford and Geiger, 1910). The charge carried by each, as measured by the same authors, is 9.3×10^{-10} electrostatic units.

β-RAYS

The β-rays are similar to the cathode rays produced by an electric discharge in a vacuum tube. They are judged to be negatively charged particles moving with high velocity. They are much more penetrating than the α-rays, and are strongly deviated by a magnetic or electric field. The velocity of the moving particle is in the neighborhood of that of light, about 2×10^{10} cm/s. The charge on each particle is approximately 4.7×10^{-10} electrostatic units.

γ-RAYS

The γ-rays, emitted by radium and other radioactive substances are similar to the X-rays and are not deviable by magnetic or electric fields. They are more penetrating than either the α or β-rays.

X-RAYS OR RÖNTGEN RAYS

X-rays are emitted from a substance when it is bombarded by a stream of electrons at a sufficiently high velocity. Secondary X-rays are emitted from substances which are themselves receiving a primary X-ray radiation.

Scale of Hardness

The "radiochrometer" of Benoist consists of a disk of silver 0.11 mm thick, which is surrounded by 12 sectors of aluminum ranging in thickness from 1 to 12 millimeters. The sector which shows the same absorption as the central disk gives the degree of hardness according to Benoist. The relation of this to other scales is shown below.

Benoist	2	3	4	5	6	7	8
Wehnelt	1.8–2	5	6.5	7.5	8	9	10–11
Walter	2.0–3	4–5	5–6	6	6–7	7	7–8

The absorption of rays is very nearly proportional to the mass of substance penetrated.

IONIZATION DUE TO RÖNTGEN RAYS IN VARIOUS GASES

MEAN ABSORPTION COEFFICIENTS

(From Smithsonian Physical Tables)

If I_0 be the intensity of a parallel beam of homogeneous radiation incident normally on a plate of absorbing material of thickness t, then $I = I_0 e^{-\lambda x}$ gives the intensity I at the depth x. Because of the great homogeneity of the secondary X-rays they were used in the determination of the following coefficients. The coefficients λ have been divided by the density d.

MASS ABSORPTION COEFFICIENTS FOR X AND γ RAYS

Radiation traversing a layer of substance is reduced in intensity by a constant fraction μ per centimeter. After penetrating to a depth x the intensity is $I = I_0 e^{-\mu x}$ where I_0 is the intensity at the surface. μ/ρ is the mass absorption coefficient where ρ is the density of the material.

Values of μ/ρ for λ = .005 Å to λ = 44.6 Å. Where two values of μ/ρ for one value of λ occur they represent the maximum and minimum values at an absorption discontinuity.

Compiled by S. J. M. Allen

λ = 44.6 – 2.74 Å

X-RAY SPECTRA AND ATOMIC NUMBERS

(From Smithsonian Physical Tables)

Kaye has shown that an element excited by sufficiently rapid cathode rays emits characteristic Röntgen radiations. These have been analyzed and the wave lengths obtained by Moseley (Phil. Mag. 27, p. 703, 1914) using a crystal of potassium ferrocyanide as a grating. The "K" series of elements shows 2 lines α and β, the "L" series several. The wave lengths of the α and β lines of each series are given in the following table. $Q_K = (v/\tfrac{3}{4}\,v_0)^{\frac{1}{2}}$; $Q_L = (v/\tfrac{5}{36}\,v_0)^{\frac{1}{2}}$ where v is the frequency of the α line and v_0 the fundamental Rydberg frequency. The atomic number for the K series = $Q_K + 1$; for the L series = $Q_L + 7.4$ approximately. $v_0 = 3.29 \times 10^{15}$

Element	α line $\lambda \times 10^8$ cm.	Q_K	Atomic number N	β line $\lambda \times 10^8$ cm.	Element	α line $\lambda \times 10^8$ cm.	Q_L	Atomic number N	β line $\lambda \times 10^8$ cm.

Moseley's summary condensed is as follows: Every element from Al to Au is characterized by an integer N which determines its X-ray spectrum; N is identified with the number of positive units of electricity in its atomic nucleus. The order of these atomic numbers (N) is that of the atomic weights except where the latter disagrees with the order of the chemical properties. Known elements correspond with all the numbers between 13 and 79 except 3. There are here 3 possible elements still undiscovered. The frequency of any line in the X-ray spectrum is approximately proportional to $A(N-b)^2$, **where A and b are constants. All X-ray spectra of each series are similar in structure differing only in wave lengths.**

X-RAY CRYSTALLOGRAPHIC DATA

Compiled with the collaboration of John G. Albright

The following table presents crystallographic data for about 1300 compounds. For convenience they have been separated into; elements, inorganic compounds, minerals, metal-organic compounds and organic compounds. Alloys will be found among the inorganic compounds under one or the other of the metal constituents.

The crystal system is given using abbreviations indicated below. The type of structure is indicated by reference to certain characteristic compounds. The space group is indicated by the symbols of the Shoenflies system. The dimensions of the unit cell *a*, *b*, and *c* in angstrom units are given in order followed in some cases by axial angles. The last column indicates the number of molecules per unit cell.

For an explanation of the space group symbols, structure types or other details of crystallographic data see Wyckoff: The Structure of Crystals.

Abbreviations: b.c., body centered; c.p., close packed; cub., cubic; dia., diamond; f.c., face centered, hex., hexagonal; monocl., monoclinic; rhbdr., rhombohedral; rhomb., rhombic; tetr., tetragonal; tricl., triclinic.

LIGHT

PHOTOMETRIC QUANTITIES, UNITS AND STANDARDS

Photometric quantities and units are also given in the section Quantities and Units under the sub-division Light.

Candle (or International Candle). The candle is the unit of luminous intensity. It is a specified fraction of the average horizontal candlepower of a group of 45 carbon-filament lamps preserved at the Bureau of Standards.

Lumen. The lumen is the unit of luminous flux. It is equal to the flux through a unit solid angle (steradian) from a uniform point source of one candle, or to the flux on a unit surface all points of which are at unit distance from a uniform point source of one candle.

Illumination. Illumination is the density of the luminous flux on a surface. It is the quotient of the flux by the area of the surface when the latter is uniformly illuminated.

Least Mechanical Equivalent of Light. One lumen at the wavelength of maximum visibility (0.556μ) equals 0.00161 watts ($=0.000385$ gram calories per sec.); one watt at the same wavelength equals 621 lumens.

Relative Visibility. The relative visibility factor for a particular wavelength is the ratio of the visibility factor for that wavelength to the maximum visibility factor.

Values of the relative visibility are given as a part of the specification of the standard observer under Colorimetry.

Efficiency of a Source of Light. The efficiency of a source is the ratio of the total luminous flux to the total power consumed. In the case of an electric lamp it is expressed in lumens per watt.

Spherical Candlepower. The spherical candlepower of a lamp is the average candlepower of the lamp in all directions in space. It is equal to the total luminous flux of the lamp in lumens divided by 4π.

FLAME STANDARDS

Value of Various Former Standards in International Candles

Standard Pentane Lamp, burning pentane......	10.0 candles
Standard Hefner Lamp, burning amyl acetate...	0.9 "
Standard Carcel Lamp, burning colza oil.......	9.6 "

The *Carcel unit* is the horizontal intensity of the carcel lamp, burning 42 grams of colza oil per hour. For a consumption between 38 and 46 grams per hour the intensity may be considered proportional to the consumption.

The *Hefner unit* is the horizontal intensity of the Hefner lamp burning amyl acetate, with a flame 4 cm. high. If the flame is l mm. high, the intensity $I = 1 + 0.027(l - 40)$.

EFFICIENCIES OF ILLUMINANTS

The rating listed is the commercial rating of the lamp. The absolute efficiency is the equivalent power in light flux (at 0.556μ) per watt input. Efficiency is given in lumens per watt input.

Lamp	Rating, or Specifications	Eff.	Ab. Eff.
Acetylene..............	1.0 liters per hour	.67	0.0011

WAVE LENGTH OF THE PRINCIPAL LINES IN THE EMISSION SPECTRA OF THE ELEMENTS

The following table gives the wave lengths of the principal lines of the emission spectra of elementary substances, produced by the arc, spark or Geissler tube.

Wave Lengths are stated in ångstroms and refer to air at a pressure of 1 atmosphere except in the Schumann region. 1 ångstrom (Å) = 10^{-8} cm. = 10^{-4} microns (μ) = 10^{-1} millimicrons ($m\mu$) = $100\mu\mu$.

Intensities of lines are indicated by the numbers 1 to 10, the latter, the higher intensity. For more complete tables the reader is referred to Kayser: *Handbuch der Spektroscopie.*

Characteristics of the lines are indicated by symbols following the intensity numbers, as shown below.

The **number of components** of an unresolved line is indicated by the subscripts: $_2$, $_3$, $_4$ attached to the intensity number.

Classes of spectra are indicated by the symbols I, II, III etc. referring to lines emitted by the neutral, ionized or doubly ionized atom. These symbols preceed the wave length.

Persistent lines are indicated by p. The most sensitive of the persistent lines by P. These symbols follow the wave length.

r, easily reversed
n, broad or nebulous
N, very broad and diffuse
<, broadened toward greater wave lengths
>, broadened toward shorter wave lengths
$_2$, $_3$, $_4$, etc. unresolved line of 2, 3 or 4 components
I, II, III etc. classes of spectra emitted by neutral, ionized or doubly ionized atom respectively
p, persistent lines
P, the most sensitive of the persistent lines.

STANDARD WAVE LENGTHS

Primary Standard

Wave length of the red cadmium line in air, 760 mm. pressure 15°C., measures of Benoit, Fabry and Perot 1907,
6438.4696 Ångström units

SECONDARY STANDARDS. Lines of the Iron Arc

Selected lines from list by Ch. Fabry: *International Critical Tables*, 1929. Wave lengths in international Ångströms, atmospheric pressure, 15°C.

Wave-length	Wave-length	Wave-length	Wave-length	Wave-length

3907.937	4547.851	5192.353	6027.058	

SECONDARY STANDARDS

Spectra of helium, neon, argon, krypton and xenon. Comparison with the primary standard made by interferometer methods. Wave lengths in Ångström units.

Helium

Merrill, Bulletin 14, Bulletin of Standards 1917.

INDEX OF REFRACTION.

Indices of refraction for elements, inorganic, metal-organic and organic compounds will be found in the tables of physical constants for the various classes of substances in the section Properties and Physical Constants.

Values for compounds not there listed and data subsequently collected are given below.

Indices not otherwise indicated are for sodium light, $\lambda = 589.3$ mμ. Other wave lengths are indicated by the value in millimicrons or symbol in parentheses which follows the index. Wave lengths are indicated as follows: He, $\lambda = 587.6$ mμ; Li, $\lambda = 670.8$ mμ; Hg, $\lambda = 579.1$ mμ; A, $\lambda = 759.4$ mμ; C, $\lambda = 656.3$ mμ; D, $\lambda = 589.3$ mμ; F, $\lambda = 486.1$ mμ.

Temperatures are understood to be 20°C for liquids, or ordinary room temperatures in the case of solids. Other temperatures appear as superior figures with the index.

Indices for the elements and inorganic compounds will be understood to be for the solid form except as indicated by the abbreviation liq.

Elements

See also under Physical Constants of Inorganic Compounds and Index of Refraction of Gases.

Name	Formula	Index
Bromine (liq.)	Br_2	1.661^{15}
Cadmium (liq.)	Cd	0.82 (579 mμ)
(sol.)		1.13
Chlorine (liq.)	Cl_2	1.385
" (gas)		1.000768
Hydrogen (liq.)	H_2	$1.0974^{-252.83}$(579 mμ)
Iodine (sol.)	I_2	3.34
(gas)		1.001920
Lead	Pb	2.6 (579 mμ)
Mercury (liq.)	Hg	1.6–1.9
Nitrogen (liq.)	N_2	1.2053^{-190}
Oxygen (liq.)	O_2	1.221^{-181}
Phosphorus (yel.) (sol.)		2.1442^{25}
Selenium	Se_8	3.00, 4.04
" (amor.) (sol.)		2.92
Sodium (liq.)	Na	0.0045
(sol.)		4.22
Sulfur (liq.)	S_8	1.929^{110}
" (amor.) (sol.)		1.998
" (rhombic, α)		1.957, 2.0377, 2.2454
Tin (liq.)	Sn	2.1

Inorganic Compounds

See also under Physical Constants of Inorganic Compounds.

Aluminum carbide	Al_4C_3	2.7, 2.75 (700 mμ)
chloride	$AlCl_3.6H_2O$	1.560, 1.507
oxide	Al_2O_3	1.665–1.680, 1.63–1.65
Alums. See under appropriate element.		
Ammonium antimonyl tartrate	$2(NH_4.SbO.C_4H_4O_6).H_2O$	β1.6229 (C)
orthoarsenate, di-H	$NH_4H_2AsO_4$	1.5766, 1.5217
bromide	NH_4Br	1.7108
perchlorate	NH_4ClO_4	1.4818, 1.4833, 1.4881
chloroplatinate	$(NH_4)_2PtCl_6$	1.8
fluoride	NH_4F	ω<1.328
" acid	NH_4HF_2	1.385, 1.390, 1.394
hydrogen malate (d)	$NH_4C_4H_5O_5$	β1.503
nitrate	NH_4NO_3	1.413, 1.611(He), 1.637

INDEX OF REFRACTION (Continued)

Inorganic Compounds (Continued)

Name	Formula	Index
Ammonium sulfate, acid	NH_4HSO_4	1.463, 1.473, 1.510
tartrate (*dl*)	$(NH_4)_2C_4H_4O_6.2H_2O$	β1.564
thiocyanate	NH_4CNS	1.546, 1.685, 1.692
uranyl acetate	$NH_4C_2H_3O_2.UO_2(C_2H_3O_2)_2$	1.4808, 1.4933
Antimony bromide	$SbBr_3$	>1.74+
iodide, tri-	SbI_3	2.78 (Li), 2.36
Barium cadmium bromide	$BaCdBr_4.4H_2O$	β1.702
cadmium chloride	$BaCdCl_4.4H_2O$	β1.651
calcium propionate	$BaCa_2(C_3H_5O_2)_6$	1.4442
fluochloride	$BaCl_2.BaF_2$	1.640, 1.633
fluoride	BaF_2	1.475 also 1.4741
Barium oxide	BaO	1.980
*ortho*phosphate, di-	$BaHPO_4$	1.617, 1.63±, 1.635
propionate	$Ba(C_2H_5CO_2)_2.H_2O$	β1.5175
sulfide, mono-	BaS	2.155
Cadmium ammonium chloride	$CdCl_2.4NH_4Cl$	1.6038, 1.6042
cesium sulfate	$CdSO_4.Cs_2SO_4.6H_2O$	1.498, 1.500, 1.506
fluoride	CdF_2	1.56
magnesium chloride	$(CdCl_2)_2.MgCl_2.12H_2O$	1.49, 1.5331, 1.5769
oxide	CdO	2.49 (Li)
potassium chloride	$CdCl_2.4KCl$	1.5906, 1.5907
" cyanide	$Cd(CN)_2.2KCN$	1.4213
rubidium sulfate	$CdSO_4.Rb_2SO_4.6H_2O$	1.4798, 1.4848, 1.4948
Calcium aluminate	$Ca_3Al_2O_6$	1.710
borate	$CaO.B_2O_3$	1.540, 1.656, 1.682
carbide	CaC_2	>1.75
copper acetate	$CaCu(C_2H_3O_2)_4.6H_2O$	1.436, 1.478
cyanamide	$CaCN_2$	1.60, >1.95
dithionate	$CaS_2O_6.4H_2O$	1.5516, 1.5414
*pyro*phosphate	$Ca_2P_2O_7$	1.585, 1.60±, 1.605
platinocyanide	$CaPt(CN)_4.5H_2O$	1.623, 1.644, 1.767
strontium propionate	$Ca_2Sr(C_3H_5O_2)_6$	1.4871, 1.4956

MOLECULAR REFRACTION

The molecular refraction of a substance may be computed by the following relation,—

$$N = \frac{M(n^2 - 1)}{d(n^2 + 2)}$$

where N is the molecular refraction for a specified wave length and temperature, M, the molecular weight, d, the density and n the refractive index for the specified conditions.

LIQUIDS FOR INDEX BY IMMERSION METHOD

Liquid	N_D 24° C
Trimethylene chloride	1.446
Cineole	1.456
Hexahydrophenol	1.466
Decahydronaphthalene	1.477
Isoamylphthalate	1.486
Tetrachloroethane	1.492
Pentachloroethane	1.501
Trimethylene bromide	1.513

OPTICAL CONSTANTS OF METALS

The following table gives the refractive index n, the absorption index k, the angle of principle incidence $\bar{\phi}$, the angle of principle azimuth $\bar{\psi}$ and the percent of light reflected R.

The reduction of amplitude of the wave of the wave length λ after traveling any distance d in the medium is given by the ratio $1 : e^{\frac{2\pi dk}{\lambda}}$. $\bar{\phi}$ is the angle of incidence for which the phase change between the two rectangular components vibrating in and normal to the plane of incidence is 90°. $\bar{\psi}$ is the azimuth at which circularly polarized light results. These quantities are connected by the following relations

$$k = \tan 2\bar{\psi}(1 - \cot^2 \bar{\phi}), \qquad n = \frac{\sin \bar{\phi} \tan \bar{\phi}}{(1+k^2)^{\frac{1}{2}}} (1 + \tfrac{1}{2} \cot^2 \bar{\phi})$$

DISPERSION

The dispersion for various types of optical glass is shown in the following table. n_D = index of refraction for the D line (of the solar spectrum) and n_F and n_C the index for the F and C lines respectively $(n_F - n_D)$ shows the dispersion for these two wave lengths.

Glass.	n_D	$(n_F - n_C)$
Light phosphate crown	1.5159	.00737
Barium-silicate crown	1.5399	.00909
High-dispersion crown	1.5262	.01026
Borate flint	1.5686	.01102
Extra light flint	1.5398	.01142
Heavy flint	1.7174	.02434
Heaviest flint	1.9626	.04882

INDEX OF REFRACTION OF METALS

For Sodium Light

(Drude.)

Metal.	Index of refraction.	Metal.	Index of refraction.
Aluminum	1.44	Mercury	1.73
Antimony	3.04	Nickel	1.79
Bismuth	1.90	Platinum	2.06
Cadmium	1.13	Silver	0.181
Copper	0.641	Steel	2.41
Gold	0.366	Tin, solid	1.48
Iron	2.36	Tin, fluid	2.10
Lead	2.01	Zinc	2.12
Magnesium	0.37		

INDEX OF REFRACTION, GASES

Values are relative to a vacuum and for a temp. of 0° C. and 760 mm. pressure.

(From Smithsonian Tables.)

Substance.	Kind of light.	Indices of refraction.	Observer.
Acetone	*D*	1.001079–1.001100	
Air	*D*	1.0002926	Perreau
Ammonia	white	1.000381–1.000385	
Ammonia	*D*	1.000373–1.000379	
Argon	*D*	1.000281	Rayleigh

COEFFICIENT OF TRANSPARENCY OF UVIOL GLASS FOR THE ULTRA-VIOLET

For a thickness of 1 mm.

Wave length, microns	0.280	0.309	0.325	0.346	0.361	0.383	0.397
Uviol crown	0.56	0.95	0.990	0.996	0.999	1.000	1.000

REFLECTION OF LIGHT BY GLASS IN AIR

The table gives the percentage *R* of light reflected by one surface of glass having a refractive index of 1.55 relative to air. The angle of incidence is *i*, and the angle of refraction is *r*. The two components of the polarized light are marked $\parallel$ and $\perp$ according to the electric vector of the vibration. (Computed according to Fresnel's formula.)

i	*r*	$\parallel$	$\perp$	*R*
0	0° 0′	4.65	4.65	4.65
10	6° 26′	4.84	4.47	4.65
20	12° 45′	5.45	3.91	4.68
30	18° 49′	6.64	2.99	4.81
40	24° 30′	8.76	1.75	5.26
50	29° 37′	12.54	0.46	6.50
60	26° 2′	19.35	0.11	9.73
70	32° 41′	31.99	4.00	18.00
80	40° 33′	55.74	23.34	39.54
90	49° 49′	100.00	100.00	100.00

REFLECTION BY TRANSPARENT MEDIA IN AIR

For Normal Incidence

The table gives the per cent of the normally incident light which is reflected by transparent media of various indices of refraction. *n* = index of refraction, *R* = reflected light, *i* = angle of incidence = 0.

(Computed from Fresnel's formula.)

n	*R*	*n*	*R*	*n*	*R*
1.0	0.00	1.7	6.72	2.4	17.0
1.1	0.23	1.8	8.16	2.5	18.4
1.2	0.83	1.9	9.63	2.6	19.8
1.3	1.70	2.0	11.11	2.7	21.1
1.4	2.78	2.1	12.6	2.8	22.5
1.5	4.00	2.2	14.1	2.9	23.8
1.6	5.33	2.3	15.5	3.0	25.0

COEFFICIENT OF TRANSPARENCY OF GLASS FOR THE INFRA-RED

Normal incidence, thickness 1 cm.

Wave length, microns....	0.7	1.1	1.7	2.3	2.7	3.1
Crown, borate..........	1.00	.55	.21	.025	.04

Temperature Corrections

Below 20°C the correction should be subtracted from the per cent sugar. Above 20°C the correction is to be added to the per cent sugar.

TRANSMISSION OF COLORED GLASSES

If I_o is the intensity of radiation entering a layer of some medium and I the intensity reaching the opposite surface, the ratio I/I_o is called the transmittance. In practice the ratio of intensity of radiation passing through a glass sample to that incident on its surface is often measured and plotted as transmission. The transmission is the result of two factors, the transmittance of the glass and the losses by reflection. These losses amount to about 4% for each glass-air surface; the transmission of a sample is about 92% of its transmittance. Since the reflection losses differ slightly with different samples, the correction is often determined and applied when the transmission is measured. Values which are thus corrected are marked * at the head of the column.

In order to obtain the transmittance for thicknesses other than those listed it is convenient to transform the tabular values to terms of βt in the equation $I/I_o = e^{\beta t}$ where t is the thickness (in millimeters) and β a constant for a particular sample. The base 10 is conveniently used in place of e so that βt becomes the common logarithm of the transmittance, or $\beta t = \log I/I_o$. Using the corrected value of the transmittance for a specific thickness, found in the table, the value of βt may be found, changed to the value for the new thickness and the transmittance for the second thickness computed.

For example: The tabular value of transmission for sample **CG** 396 at $\lambda = .46\mu$ is given as 0.80 for a thickness of 2 mm. It is desired to find the transmittance for 5 mm.

The corrected value of the transmittance for 2 mm is 0.80/.92 or about 0.871. Log .871 = 9.94002–10. Writing this as a wholly negative number the equation becomes $\beta t = -.05998$. For $t = 5$ $\beta t = -.05998 \times 5/2 = -.14995$ or changing to the more familiar form gives 9.85005–10 which is the logarithm of the new transmittance which is found to be .708. The transmission will be .92 × .708 or .651.

In order to identify the glasses listed, the manufacturer's number is given preceded by an abbreviation of the maker's name, as follows: **AO,** American Optical Co.; **BL,** Bausch & Lomb Optical Co.; **CE,** Chicago Eye Shield Co.; **CG,** Corning Glass Works. Data for Jena glasses are given separately in section II of the table.

This table has been compiled with the assistance of: Mr. H. P. Gage, Corning Glass Works; Mr. J. Liautaud, Chicago Eye Shield Co.; Mr. W. B. Rayton, Bausch & Lomb Optical Co.; Mr. A. J. Weinstein of the Fish-Shurman Corporation.

TRANSMISSIBILITY FOR RADIATIONS

Ratio of the transmitted light to the incident light for a definite thickness of the substance, usually 1 cm.

Glass.

Glass in general is opaque to the ultra-violet and infra-red. Uviol glass is transparent to the longer radiations of the ultra-violet.

Coefficient of transparency of glass for visible and ultra-violet radiations.

	Normal incidence, thickness 1 cm.

Quartz

Quartz is very transparent to the ultra-violet and to the visible spectrum, but opaque for the infra-red beyond 7.0μ.

(Pflüger.)

Wave length, microns	0.19	0.20	0.21	0.22
Transmission for 1 mm	.67	.84	.92	.94

Fluorite

Fluorite is very transparent to the ultra-violet, nearly to 0.10μ. Coefficient of transparency at $\lambda = 186$ is found by Pflüger to be 0.80.

For the infra-red the values are given in a table below.

TRANSMISSIBILITY FOR RADIATIONS (Continued)

Antimony trisulphide.........	calcium sulphide	0.569	yellow	Bruninghaus, 1910
Bismuth oxide...	calcium oxide	0.522	blue	Bruninghaus, 1910
Bismuth sulphate.	calcium sulphate	0.640	red	Bruninghaus, 1910
Manganous carbonate........	magnesium carbonate	0.620	red	Bruninghaus, 1910
oxide.........	calcium oxide	0.589	yellow	Lecoq & Boisbaudra 1886
phosphate.....	calcium phosphate $Ca_3(PO_4)_2$	0.633	red	Bruninghaus, 1910
sulphate.......	calcium sulphate	0.540	green	Lecoq & Boisbaudran, 1886
sulphide.......	calcium sulphide	0.589	yellow	Bruninghaus, 1910

FLUORESCENCE OF ORGANIC SUBSTANCES IN SOLUTION

Excitation by White Light.

Substance.	Solvent.	Wave length microns.	Observer.
Anthracene......	alcohol	0.400 0.430 0.436	Stark & Meyer, 1907
Eosine..........	alcohol or water	0.589	Nichols & Merritt, 1907
Esculine.........	alcohol	0.460	Nichols & Merritt, 1907
Fluorescein......	water (alkaline)	0.542	Nichols & Merritt, 1907
Naphthalin, red..	alcohol	0.632	Nichols & Merritt, 1907
Quinine sulphate.	water	0.437	Nichols & Merritt, 1907
Resorcin blue....	water	0.65	Nichols & Merritt, 1907
Rhodamin.......	water	0.554	Nichols & Merritt, 1907

FLUORESCENCE

Gases and Vapors.

Gas or vapor.	Condition.	Excitation.	Color or wave length of emitted light.	Observer.
Iodine...	Vapor at ordinary temperature.	Mercury arc $\lambda = .546\mu$	Strongest bands $\lambda = .5460\mu$, $.5774\mu$ .5730, .5796	Wood, 1911
Mercury .	Vapor at ordinary temperature	Spark between aluminum electrodes	Broad band $\lambda = .5900–.3000$	Wood, 1909
Oxygen ..	....	Mercury arc in quartz tube	Strongest lines $\lambda = .1849$, .1851 (ultra-violet)	Streubing, 1910
Potassium	Vapor, 300°–400° C.	White light	Many strong lines from .6416–.6768, strongest .6544 and .6584	Wood & Carter, 1908
Rubidium	Vapor, at 270° C.	White light (elec. arc)	Strong red band $\lambda = .6900-.6620$.	Dunoyer, 1912
Sodium ..	Vapor at 350° C.	White light (elec. arc)	D, $\lambda = .5893$ (mean)	Dunoyer, 1912

COLORIMETRY

Selected from Judd, Jour. Opt. Soc. Amer. **23**, 359 (1933)

Recommendations of the International Commission on Illumination

Standard Illuminants

A. Gas-filled tungsten incandescent lamp of color temperature 2848° K.

B. Noon Sunlight. Lamp as above in combination with the Davis-Gibson filter for converting color temperature 2848° to 4800° K.

The filter is to be composed of a layer one centimeter thick of each of two separate solutions B_1 and B_2, contained in a double cell of colorless optical glass.

Solution B_1

Copper sulphate ($CuSO_4 \cdot 5H_2O$)	2.452	g
Mannite ($C_6H_8(OH)_6$)	2.452	g
Pyridine (C_5H_5N)	30.0	cc
Distilled water to make	1000	cc

Solution B_2

Cobalt ammonium sulphate ($CoSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$)	21.71	g
Copper sulphate ($CuSO_4 \cdot 5H_2O$)	16.11	g
Sulphuric acid (density 1.835)	10.0	cc
Distilled water to make	1000	cc

C. Average Daylight. Lamp as in **A** in combination with Davis-Gibson filter for converting color temperature 2848° to 6500° K.

The filter is composed of a layer one centimeter thick of each of two separate solutions C_1 and C_2, contained in a double cell made of colorless optical glass.

Solution C_1

Copper sulphate ($CuSO_4 \cdot 5H_2O$)	3.412	g
Mannite ($C_6H_8(OH)_6$)	3.412	g
Pyridine (C_5H_5N)	30.0	cc
Distilled water to make	1000	cc

Solution C_2

Cobalt ammonium sulphate ($CoSO_4 \cdot (NH_4)_2SO_4 \cdot 6H_2O$)	30.580	g
Copper sulphate ($CuSO_4 \cdot 5H_2O$)	22.520	g
Sulphuric acid (density 1.835)	10.0	cc
Distilled water to make	1000	cc

See R. Davis and K. S. Gibson Bur. Stds. Misc. Pub. No. 114, Jan. 1931 or Bur. Stds. Jour. Research **7**, 796 (1931).

Standard Coordinate System

The tristimulus system of color specification is based on four chosen stimuli consisting of homogeneous radiant energy of wave lengths

700.0 **546.1** **435.8**

$m\mu$ and of standard illuminant B (see above).

To establish the system of specification coordinates are assigned as follows:

Stimulus	x	y	z
700.0 $m\mu$	0.73467	0.26533	0.00000
546.1 $m\mu$	0.27376	0.71741	0.00883
435.8 $m\mu$	0.16658	0.00886	0.82456
Standard illuminant B:	0.34842	0.35161	0.29997

The Standard Observer

The "standard observer" is determined below by the specification for the equal energy spectrum both in fractions, x, y, z of the total amount for each wave length interval of 5 mμ and directly $\bar{x}$, $\bar{y}$, $\bar{z}$. The fractional values are known as the **trilinear coordinates** or **trichromatic coefficients** of the spectrum; the direct values as the **distribution functions** or coefficients.

The sum of the trichromatic coefficients is unity, that is $x + y + z = 1$ Therefore the value of z may be and often is omitted from a specification.

Relative Visibility

The value of $\bar{y}$ given in the table is the standard visibility function or relative visibility.

Wave length mμ	Trichromatic coefficients			Distribution coefficients for equal energy			Wave length mμ

SPECIFIC ROTATION

Specific rotation or rotatory power is given in degrees per decimeter for liquids and solutions and in degrees per millimeter for solids; + signifies right handed rotation, − left. Specific rotation varies with the wave length of light used, with temperature and, in the case of solutions, with the concentration. When sodium light is used, indicated by D in the wave length column, a value of $\lambda = 0.5893$ may be assumed.

Optical rotatory power for a large number of organic compounds will be found in the International Critical Tables, Vol. VII; for sugars, Vol. II.

Solids

Substance	Wave length μ	Rotation deg./mm	Substance	Wave length μ	Rotation deg./mm
Cinnabar (HgS)	D	+32.5	Quartz (continued)	0.3609	+63.628

SPECIFIC ROTATION (Continued)

Solutions

Corrections for values of the specific rotation for concentration are given in the last column. *c* indicates concentration in grams per 100 milliliters of solution; *d* indicates the concentration in grams per 100 grams of solution.

Substance	Solvent	Temp. °C	Wave length μ	Specific rotation deg./dm	Correction for concentration or temperature
Albumen	water	..	D	− 25 to −38	
Arabinose	water	20	D	− 105.0	
Camphor	alcohol	20	D	+ 54.4	− .135*d* for *d* = 45–91
	benzene	20	D	+ 56	− .166*d* for *d* = 47–90
	ether	..	D	+ 57	
Dextrose *d*-glucose $C_6H_{12}O_6$	water	20	D	+ 52.5	+ .025*d* for *d* = 1–18
			.5461	+ 62.03	+ .04257*c* for *c* = 6–32
Galactose	water	..	D	+ 83.9	+ .078*d* − .21*t* for *d* = 4–36 and *t* = 10–30°C
l-Glucose (β)	water	20	D	− 51.4	
Invert sugar $C_6H_{12}O_6$	water	20	D	− 19.7	− .036*c* for *c* = 9–35; $\alpha_t = \alpha_{20} + .304(t - 20) + .00165 (t - 20)^2$ for *t* = 3–30°C
		25	.5461	− 21.5	
Lactose	water	20	D	+ 52.4	+ .072 (20° − *t*) for *c* = 5
			.5461	+ 61.9	+ .085(20° − *t*) for *c* = 5
Levulose fruit sugar	water	25	D	− 88.5	− .145*d* for *d* = 2.6–18.6
		25	.5461	− 105.30	
Maltose	water	20	D	+ 138.48	− .01837*d* for *d* = 5–35
		25	.5461	+ 153.75	
Mannose	water	20	D	+ 14.1	*c* = 10.2
Nicotine	water	20	D	− 77	for *d* = 1–16
	benzene	20	D	− 164	for *d* = 8–100
Potassium tartrate	water	20	D	+ 27.14	+ .0992*c* − .00094c^2 for *c* = 8–50
Quinine sulfate	water	17	D	− 214	
Santonin	alcohol	20	D	− 161.0	*c* = 1.78
		20	D	+ 693	*c* = 4.05
	chloroform	20	D	− 202.7	+ .309*d* for *d* = 75–96.5
	alcohol	20	.6867	+ 442	*c* = 4.05
			.5269	+ 991	*c* = 4.05
			.4861	+1323	*c* = 4.05
Sodium potassium tartrate (Rochelle salt)	water	20	D	+ 29.75	− .0078*c*
Sucrose (cane sugar) $C_{12}H_{22}O_{11}$	water	20	D	+ 66.412	+ .01267*d* − .000376d^2 for *d* = 0–50; $\alpha_t = \alpha_{20}[1 - .00037 (t - 20)]$ for *t* = 14–30°C

SPECIFIC ROTATION (Continued)

MAGNETO-OPTIC ROTATION

Revised by Park L. Turrill

$$\text{Verdet's Constant: } \rho = \frac{\alpha}{tH \cos \theta}$$

The specific power of magnetic rotation ρ, is expressed in the above formula, where α is the total angle of rotation in minutes, t the thickness of the substance in centimeters through which the light beam passes, H the magnetic field intensity in gauss, and θ the angle between the direction of the magnetic field and the path of light. Determinations made with sodium light. $\lambda D = 5893$ Å.

Values from the Smithsonian Tables, the International Critical Tables, and the literature.

QUANTITIES AND UNITS

MISCELLANEOUS

QUANTITIES, UNITS, LAWS AND FORMULAE OF CHEMISTRY AND PHYSICS

The following pages give definitions of quantities, their cgs units and dimensional formulae together with the more important laws and formulae.

Formulae for capacity, inductance and high frequency resistance are given in a separate collection immediately following.

The symbols used in the dimensional formulae are as follows: m, mass; l, length; t, time; θ, temperature; ϵ, dielectric constant for a vacuum; μ, magnetic permeability of a vacuum. In the case of the quantities of electricity and magnetism dimensions are given in both the electrostatic and electromagnetic system.

CHEMICAL TERMS

Acid.—Any substance which yields hydrogen ions.

Active mass of a substance is the number of gram molecular weights per liter in solution, or in gaseous form.

Adsorption.—The condensation of gases, liquids, or dissolved substances on the surfaces of solids is called adsorption.

Atom.—The smallest unit quantity of an element that is capable of entering into chemical combination.

Atomic theory.—All elementary forms of matter are composed of very small unit quantities called atoms. The atoms of a given element all have the same size and weight. The atoms of different elements have different sizes and weights. Atoms of the same or different elements unite with each other to form very small unit quantities of compound substances called molecules.

Avogadro's number.—The number of molecules in a mole or in a mass of substance equal numerically to its molecular weight.

Avogadro's theory.—Equal volumes of all gases under the same conditions of temperature and pressure contain equal numbers of molecules.

Balanced or reversible action.—One which can be caused to proceed in either direction by suitable variation in the conditions of temperature, volume, pressure or of the quantities of reacting substances.

Base.—Any substance which yields hydroxyl ions.

Catalytic agent.—A substance which by its mere presence alters the velocity of a reaction, and may be recovered unaltered in nature or amount at the end of the reaction.

Colligative property.—A property numerically the same for a group of substances, independent of their chemical nature.

Combining weight of an element or radical is its atomic weight divided by its valence.

Combining weights, law of.—If the weights of elements which combine with each other be called their "combining weights," then elements always combine either in the ratio of their combining weights or of simple multiples of these weights.

Constitutive property.—A property which depends on the constitution or structure of the molecule.

Cryohydrate.—The solid which separates when a saturated solution freezes. It contains the solvent and the solute in the same proportions as they were in the saturated solution.

Definite proportions, law of.—In every sample of each compound substance the proportions by weight of the constituent elements are always the same.

Electrochemical equivalent of an ion is the mass liberated by the passage of unit quantity (one coulomb) of electricity.

Electrolytic dissociation or ionization theory.—When an acid, base or salt is dissolved in water or any other dissociating solvent, a part or all of the molecules of the dissolved substance are broken up into parts called ions, some of which are charged with positive electricity and are called cations, and an equivalent number of which are charged with negative electricity and are called anions.

Electrolytic solution tension theory (**or the Helmholtz double layer theory**).—When a metal, or any other substance capable of existing in solution as ions is placed in water or any other dissociating solvent, a part of the metal or other substances passes into solution in the form of ions, thus leaving the remainder of the metal or substances charged with an equivalent amount of electricity of opposite sign from that carried by the ions. This establishes a difference in potential between the metal and the solvent in which it is immersed.

Electron theory of matter.—An atom is believed to consist of a nucleus bearing a positive charge, different for each sort of atom, surrounded by electrons or negative charges equal in total charge to the positive charge of the nucleus. The nucleus may consist of a certain number of **protons** or elementary positive charges and a part of the electrons. The remaining electrons revolve as satellites around the nucleus. The

electron and the proton have equal negative and positive charges, hence a neutral atom will contain as many electrons as protons.

The protons contain practically all of the mass of the atom, the number of protons determining the atomic weight. The number of satellite electrons determines the chemical properties of the atom.

Eutectic.—A term applied to the mixture of two or more substances which has the lowest melting point.

Gay-Lussac's law of combining volumes.—If gases interact and form a gaseous product, the volumes of the reacting gases and the volumes of the gaseous products are to each other in very simple proportions, which can be expressed by small whole numbers.

Gibbs' phase rule.—$F = C + 2 - P$ F, the number of degrees of freedom of a system, is the number of variable factors (temperature, pressure and concentration) of the components, which must be arbitrarily fixed in order that the condition of the system may be perfectly defined. C, the number of the components of the system, is chosen equal to the smallest number of independently variable constituents by means of which the composition of each phase participating in the state of equilibrium can be expressed in the form of a chemical equation; the components must be chosen from among the constituents which are present when the system is in a state of true equilibrium and which take part in that equilibrium; as components are chosen the smallest number of such constituents necessary to express the composition of each phase participating in the equilibrium, zero and negative quantities of components being permissible; in any system the number of components is definite, but may alter with changes in conditions of experiment; a qualitative but not quantitative freedom of selection of components is allowed, the choice being influenced by suitability and simplicity of application. P, the number of phases of the system, are the homogeneous, mechanically separable and physically distinct portions of a heterogeneous system; the number of phases capable of existence varies greatly in different systems; there can never be more than one gas or vapor phase since all gases are miscible in all proportions, a heterogeneous mixture of solid substances forms as many phases as there are substances present.

Gram atom or gram atomic weight.—The mass in grams numerically equal to the atomic weight.

Gram-mole, gram-formula weight, gram equivalent.—Mass in grams numerically equal to the molecular weight, formula weight or chemical equivalent, respectively.

Heat of combustion of a substance is the amount of heat evolved by the combustion of 1 gram molecular weight of the substance.

Henry's law.—The amount of gas which a liquid will dissolve is directly proportional to the pressure of the gas. This holds for all gases which do not unite chemically with the solvent.

Hess' law of constant heat summation.—The amount of heat generated by a chemical reaction is the same whether reaction takes place in one step or in several steps, or all chemical reactions which start with the same original substances and end with the same final substances, liberate the same amounts of heat, irrespective of the process by which the final state is reached.

Hydrogen equivalent of a substance is the number of replaceable hydrogen atoms in 1 molecule or the number of atoms of hydrogen with which 1 molecule could react.

Hydrogen ion concentration or pH value is the logarithm of the reciprocal of the gram ionic hydrogen equivalents per liter; i.e., $pH = \log \frac{1}{(H^+)}$ per liter. Water has a concentration of H^+ ion of 10^{-7} and of OH^- ion of 10^{-7} moles per liter or a pH value of 7. Due to hydrolysis the composition of a weak acid solution titrated against a strong base is basic and of a weak base against a strong acid is acid. A truly neutral titrated solution of a strong acid or base has the same concentration of H^+ and OH^- ions as water.

Ion.—A charged atom or group of atoms in solution or in a gas. Solutions always contain equivalent numbers of positive and negative ions.

Isotope.—Elements having the same chemical properties but different atomic weights are called isotopes. Atoms of such elements are supposed to have the same number of satellite electrons but different numbers of protons in the nucleus. *See* Electron theory of matter.

Mass action, law of.—At a constant temperature the product of the active masses on one side of a chemical equation when divided by the product of the active masses on the other side of the chemical equation is a constant, regardless of the amounts of each substance present at the beginning of the action.

Molar solution contains 1 gram molecular weight of dissolved substance per liter of solution.

Mole.—A mass numerically equal to the molecular weight.

Molecular volume.—Volume occupied by one mole. Numerically equal to the molecular weight divided by the density.

Molecular weight.—The sum of the atomic weights of all the atoms in a molecule.

Molecule.—The smallest unit quantity of matter which can exist by itself and retain all the properties of the original substance.

Multiple proportions, law of.—Two elements may combine in more than one proportion by weight, but if so, the weights of one element which combine with a fixed weight of the other element, are always in a simple ratio to each other.

Normal solution contains 1 gram molecular weight of dissolved substance divided by the hydrogen equivalent of the substance per liter of solution.

Oxidation is any process which increases the proportion of oxygen or acid-forming element or radical in a compound.

Periodic law.—The physical and chemical properties of the elements are functions of their atomic numbers, and most of these properties are periodic functions.

Reduction is any process which increases the proportion of hydrogen or base-forming elements or radical in a compound.

Salt.—Any substance which yields ions, other than hydrogen or hydroxyl ions. A salt is obtained by displacing the hydrogen of an acid by a metal.

Solubility product or precipitation value is the product of the concentrations of the ions of a substance in a saturated solution of the substance.

FUNDAMENTAL QUANTITIES AND UNITS, MECHANICS AND PROPERTIES OF MATTER

Absolute units.—A system of units based on the smallest possible number of independent units. Specifically, units of force, work, energy and power not derived from or dependent on gravitation.

Acceleration.—The time rate of change of velocity in either speed or direction, measured by the change in unit time. Cgs unit,—one centimeter per second per second. Dimensions,—$[l\ t^{-2}]$. *See also under* Angular acceleration.

Acceleration due to gravity.—The acceleration of a body freely falling in a vacuum. The International Committee on Weights and Measures has adopted as a standard or accepted value, 980.665 cm/sec^2 or 32.174 ft./sec^2.

Acceleration due to gravity at any latitude and elevation.—If ϕ is the latitude and H the elevation in centimeters the acceleration in cgs units is, $g = 980.616 - 2.5928 \cos 2\phi + 0.0069 \cos^2 2\phi - 3.086 \times 10^{-6} H$.
(Helmert's equation.)

Action is measured by the product of work by time. Cgs units of action are the erg-second and the joule-second. Dimensions,—$[m\ l^2\ t^{-1}]$. Planck's quantum or constant of action is 6.554×10^{-27} erg-seconds.

Altitudes with the barometer.—If b_1 and b_2 denote the corrected barometer readings at two stations, t the mean of the

temperatures, t_1 and t_2 of the air at the two stations, e_1 and e_2, the tension of water vapor at the two stations, h, the mean height above sea level, ϕ the latitude, then the difference in elevation in centimeters is $H = 1{,}843{,}000 (\log b_1 - \log b_2) (1 + 0.00367t) (1 + 0.0026 \cos 2\phi + 0.00002h + \frac{3}{8} k)$, where

$$k = \tfrac{1}{2}\left(\frac{e_1}{b_1} + \frac{e_2}{b_2}\right)$$

An approximate formula, sufficient for differences not over 1000 meters is

$$H = 1{,}600{,}000 \frac{b_1 - b_2}{b_1 + b_2} (1 + 0.004t).$$

Amplitude.—The maximum value of the displacement in an oscillatory motion.

Angle.—The ratio between the arc and the radius of the arc. Units of angle,—the radian, the angle subtended by an arc equal to the radius; the degree, 1/360 part of a circumference. Dimensions,—unity.

Angular acceleration.—The time rate of change of angular velocity either in angular speed or in direction of the axis of rotation (precession). Cgs unit,—one radian per second per second. Dimensions,—$[t^{-2}]$.

If the initial angular velocity is ω_0, and the velocity after time t is ω_t, the angular acceleration,

$$A = \frac{\omega_t - \omega_0}{t}.$$

The angular velocity after time t,

$$\omega_t = \omega_0 + At.$$

The angle swept out in time t,

$$\theta = \omega_0 t + \tfrac{1}{2} At^2.$$

The angular velocity after movement through the arc θ,

$$\omega = \sqrt{\omega_0^2 + 2A\theta}.$$

In the above equations, for angular displacement in radians, angular velocity will be in radians per second and angular acceleration in radians per second per second.

Angular harmonic motion or harmonic motion of rotation.—Periodic, oscillatory angular motion in which the restoring torque is proportional to the angular displacement. Torsional vibration.

Angular momentum or moment of momentum.—Quantity of angular motion measured by the product of the angular velocity and the moment of inertia. Cgs unit,—unnamed, its nature is expressed by g-cm²/sec. Dimensions,—$[m\, l^2\, t^{-1}]$.

The angular momentum of a mass whose moment of inertia is I, rotating with angular velocity ω, is $I\,\omega$.

Angular velocity.—Time rate of angular motion about an axis. Cgs unit,—one radian per second. Dimensions,—$[t^{-1}]$.

If the angle described in time t is θ, the angular velocity,

$$\omega = \frac{\theta}{t}.$$

θ in radians and t in seconds gives ω in radians per second.

Archimedes principle.—A body wholly or partly immersed in a fluid is buoyed up by a force equal to the weight of the fluid displaced. A body of volume V cm^3 immersed in a fluid of density d grams per cm^3 is buoyed up by a force in dynes,

$$F = dg\,V.$$

A floating body displaces its own weight of liquid.

Area, unit of.—The square centimeter. The area of a square whose sides are one centimeter in length. Other units of area are similarly derived. Dimensions,—$[l^2]$.

Bernoulli's theorem.—At any point in a tube through which a liquid is flowing the sum of the pressure energy, potential energy, and kinetic energy is a constant. If p is pressure; h, height above a reference plane; d, density of the liquid, and v, velocity of flow,

$$p + hdg + \tfrac{1}{2}\,dv^2 = \text{a constant.}$$

Bulk modulus.—The modulus of volume elasticity,

$$M_B = \frac{p_2 - p_1}{\dfrac{v_1 - v_2}{v_1}}$$

where p_1, p_2; v_1, v_2 are the initial and final pressure and volume respectively.

Capillary constant or specific cohesion,

$$a^2 = \frac{2T}{(d_1 - d_2)g} = hr$$

where T is surface tension, d_1 and d_2 the densities of the two fluids, g the acceleration due to gravity, h the height of rise in a capillary tube of radius r. *See* Surface tension.

Centripetal force.—The force required to keep a moving mass in a circular path. Centrifugal force is the name given to the outward force of a mass in rotation.

Compressibility.—Reciprocal of the bulk modulus.

Conservation of energy.—In every modification of a material system not affected by forces foreign to the system the sum of its potential and kinetic energies remains constant.

Conservation of momentum.—If two bodies of masses m_1 and m_2 have, before impact, velocities v_1 and v_2 and after impact velocities u_1 and u_2,

$$m_1 u_1 + m_2 u_2 = m_1 v_1 + m_2 v_2.$$

Couple.—Two equal and oppositely directed parallel but not colinear forces acting upon a body form a couple. The moment of the couple or torque is given by the product of one of the forces by the perpendicular distance between them. Dimensions,— $[m\ l^2\ t^{-2}]$.

Density.—Concentration of matter, measured by the mass per unit volume, expressed as grams per cubic centimeter. Dimensions,— $[m\ l^{-3}]$.

Diffusion.—If the concentration (mass of solid per unit volume of solution) at one surface of a layer of liquid is d_1, and at the other surface d_2, the thickness of the layer h and the area under consideration A, then the mass of the substance which diffuses through the cross-section A in time t is,

$$m = \Delta A \ \frac{(d_2 - d_1)t}{h}.$$

where Δ is the coefficient of diffusion.

Diffusivity or coefficient of diffusion is also given by Δ in the equation

$$\frac{dQ}{dt} = -\Delta \left(\frac{dc}{dx}\right) dy\ dz$$

where dQ is the amount passing through an area $dy\ dz$ in the direction of x in a time dt where dc/dx is the rate of increase of volume concentration in the direction of x. Dimensions,- $[l^2\ t^{-1}]$.

Dimensional formulae.—If mass, length, and time are considered fundamental quantities, the relation of other physical quantities and their units to these three may be expressed by a formula involving the symbols l, m and t respectively, with appropriate exponents. For example; the dimensional formula for volume would be expressed,— $[l^3]$; velocity,— $[l\ t^{-1}]$; force— $[m\ lt^{-2}]$. Other fundamental quantities used in dimensional formulae may be indicated as follows; θ, temperature; ϵ, the dielectric constant of a vacuum; μ, the magnetic permeability of a vacuum.

Diminution of pressure at the side of a moving stream.—If a fluid of density d moves with a velocity v the diminution of pressure due to the motion is (neglecting viscosity),

$$p = \tfrac{1}{2}\ dv^2.$$

Displacement or elongation at any instant. The distance of a vibrating or oscillating particle from its position of equilibrium.

Elasticity.—The property by virtue of which a body resists and recovers from deformation produced by force.

Elastic limit.—The smallest value of the stress producing permanent alteration.

Elastic moduli:

Young's modulus by stretching.—If an elongation s is pro-

duced by the weight of the mass m, in a wire of length l, and radius r, the modulus,

$$M = \frac{mgl}{\pi r^2 s}.$$

Young's modulus by bending, bar supported at both ends. If a flexure s is produced by the weight of mass m, added midway between the supports separated by a distance l, for a rectangular bar with vertical dimensions of cross-section a and horizontal dimension b, the modulus is,

$$M = \frac{mgl^3}{4sa^3b}.$$

For a cylindrical bar of radius r,

$$M = \frac{mgl^3}{12\pi r^4 s}.$$

For a bar supported at one end. In the case of a rectangular bar as described above,

$$M = \frac{4mgl^3}{sa^3b}.$$

For a round bar supported at one end,

$$M = \frac{4mgl^3}{3\pi r^4 s}.$$

Modulus of Rigidity.—If a couple C ($=mgx$) produces a twist of θ radians in a bar of length l and radius r, the modulus is

$$M = \frac{2Cl}{\pi r^4 \theta}.$$

The substitution in the above formulae for the elastic coefficients of m in grams, g in cm per sec, l, a, b, and r in cm, s in cm^2, and C in dyne-cm will give moduli in dynes per cm^2.

The dimensions of elastic moduli are the same as of stress,—$[m\, l^{-1}\, t^{-2}]$.

Coefficient of restitution.—Two bodies moving in the same straight line, with velocities v_1 and v_2 respectively, collide and after impact move with velocities v_3 and v_4. The coefficient of restitution is

$$C = \frac{v_4 - v_3}{v_2 - v_1}.$$

Energy.—The capability of doing work. **Potential energy** is energy due to position of one body with respect to another or to the relative parts of the same body. **Kinetic energy** is energy due to motion. Cgs units,—the erg, the energy expended when a force of one dyne acts through a distance of one centimeter; the joule is 1×10^7 ergs. Dimensions,—$[m\, l^2\, t^{-2}]$.

The potential energy of a mass m, raised through a distance h, where g is the acceleration due to gravity, is

$$E = mgh.$$

The kinetic energy of mass m, moving with a velocity v, is

$$E = \frac{1}{2} mv^2.$$

Energy will be given in ergs if m is in grams, g in cm per sec^2, h in cm and v in cm per sec.

Energy of rotation.—If a mass whose moment of inertia about an axis is I, rotates with angular velocity ω about this axis, the kinetic energy of rotation will be,

$$E = \frac{1}{2} I \omega^2.$$

Energy will be given in ergs if I is in g-cm^2 and ω in radians per sec.

Falling bodies.—For bodies falling from rest conditions are as for uniformly accelerated motion except that $v_o = 0$ and g is the acceleration due to gravity. The formulae become,—air resistance neglected,

$$v_t = gt, \quad s = \tfrac{1}{2}gt^2, \quad v_s = \sqrt{2gs}.$$

For bodies projected vertically upward,—if v is the velocity of projection, the time to reach greatest height, neglecting the resistance of the air,

$$t = \frac{v}{g}.$$

Greatest height,

$$h = \frac{v^2}{2g}.$$

See also under Projectiles.

Fluidity.—The reciprocal of viscosity. The cgs unit is the rhe, the reciprocal of the poise. Dimensions,—$[m^{-1} lt]$.

Force.—That which changes the state of rest or motion in matter, measured by the rate of change of momentum. Absolute unit,—the **dyne**, the force which will produce an acceleration of one centimeter per second per second in a gram mass. The gram weight or weight of a gram mass is the cgs gravitational unit. The poundal is that force which will give an acceleration of one foot per second per second to a pound mass. Dimensions,—$[m\, lt^{-2}]$.

The force F required to produce an acceleration a in a mass m is given by

$$F = ma.$$

If m is substituted in grams and a in cm per sec^2, F will be given in dynes.

Foucault's pendulum.—The rate of rotation in degrees per hour of a line on the surface of the earth relative to the plane of a Foucault's pendulum at latitude ϕ is,

$$\omega = 15 \sin\phi.$$

Frequency in uniform circular motion or in any periodic motion is the number of revolutions or cycles completed in unit time. Cgs unit,—cycles per second. Dimension,— $[t^{-1}]$.

Friction, coefficient of.—The coefficient of friction between two surfaces is the ratio of the force required to move one over the other to the total force pressing the two together.

If F is the force required to move one surface over another and W, the force pressing the surfaces together, the coefficient of friction,

$$k = \frac{F}{W}.$$

Fundamental units.—*See under* mass, length and time.

Gravitation.—The universal attraction existing between all material bodies.

The force of attraction between two masses, m and m', separated by a distance r, k being the constant of gravitation,

$$F = k\,\frac{mm'}{r^2}.$$

(If m and m' are given in grams, and r in centimeters, F will be in dynes if $k = 6.658 \times 10^{-8}$.)

Hardness.—Property of substances determined by their ability to abrade or indent one another.

An arbitrary scale of hardness is based upon ten selected minerals. For metals the diameter of the indentation made by a hardened steel sphere (Brinnell) or the height of rebound of a small drop hammer (Shore Scleroscope) serve to measure hardness.

Harmonic motion.—*See* Simple harmonic motion and Angular harmonic motion.

Hooke's law.—Within the elastic limit of any body the ratio of the stress to the strain produced is constant.

Hydrostatic pressure at a distance h from the surface of a liquid of density d,

$$P = hdg.$$

The total force on an area A due to hydrostatic pressure,

$$F = PA = Ahdg.$$

Force in dynes and pressure in dynes per cm^2 will be given if h is in cm, d in g per cm^3 and g in cm per sec^2.

Inertia.—The resistance offered by a body to a change of its state of rest or motion, a fundamental property of matter. Dimension,— $[m]$.

Kepler's laws.

I. The planets move about the sun in ellipses, at one focus of which the sun is situated.

II. The radius vector joining each planet with the sun describes equal areas in equal times.

III. The cubes of the mean distances of the planets from the sun are proportional to the squares of their times of revolution about the sun.

Length, units of.—The centimeter, one of the three fundamental units of the cgs system, is 1/100 the length of the International Prototype Meter, at Paris, at zero degrees centigrade. The meter is 1,553,164.13 times the wave length of the red cadmium line in air, 760 mm pressure, 15°C. The standard in the British system is the yard, the prototype of which is kept by the British government. The United States standard yard is defined as 3600/3937 meter.

Mass.—Quantity of matter. **Units of mass,**—the gram is 1/1000 the quantity of matter in the International Prototype Kilogram; one of the three fundamental units of the cgs system. The British standard of mass is the pound, of which a standard is preserved by the government. The United States standard mass is the avoirdupois pound defined as 1/2.20462 kilogram.

Mass by weighing on a balance with unequal arms.—If W_1 is the value for one side, W_2, the value for the other, the true mass,

$$W = \sqrt{W_1 W_2}.$$

Modulus of elasticity.—The stress required to produce unit strain, which may be a change of length (Young's modulus); a twist or shear (modulus of rigidity or modulus of torsion), or a change of volume (bulk modulus), expressed in dynes per square centimeter. Dimensions,—the same as of stress, $[m\, l^{-1}\, t^{-2}]$.

Moment of force or torque.—The effectiveness of a force to produce rotation about an axis, measured by the product of the force and the perpendicular distance from the line of action of the force to the axis. Cgs unit,—the dyne-centimeter. Dimensions,—$[m\, l^2\, t^{-2}]$.

If a force F acts to produce rotation about a center at a distance d from the line in which the force acts, the force has a torque,

$$L = Fd.$$

Moment of inertia.—A measure of the effectiveness of mass in rotation. In the rotation of a rigid body not only the body's mass, but the distribution of the mass about the axis of rotation determines the change in the angular velocity resulting from the action of a given torque for a given time. Moment of inertia in rotation is analogous to mass (inertia) in simple translation. The cgs unit is g-cm². Dimensions,—$[m\, l^2]$.

If m_1, m_2, m_3 etc. represent the masses of infinitely small

particles of a body; r_1, r_2, r_3 etc. their respective distances from an axis of rotation, the moment of inertia about this axis will be,

$$I = (m_1r_1^2 + m_2r_2^2 + m_3r_3^2 + \ldots)$$

or

$$I = \Sigma\,(mr^2).$$

Momentum.—Quantity of motion measured by the product of mass and velocity. Cgs unit,—one gram-centimeter per second. Dimensions,—$[m\ l\ t^{-1}]$.

A mass m moving with velocity v has a momentum,

$$M = mv.$$

If a mass m has its velocity changed from v_1 to v_2 by the action of a force F for a time t,

$$mv_2 - mv_1 = Ft.$$

Motion, laws of.—*See* Newton's laws of motion.

Newton's laws of motion.

I. Every body continues in its state of rest or of uniform motion in a straight line except in so far as it may be compelled to change that state by the action of some outside force.

II. Change of motion is proportional to force applied and takes place in the direction of the line of action of the force.

III. To every action there is always an equal and opposite reaction.

Pascal's law.—Pressure exerted at any point upon a confined liquid is transmitted undiminished in all directions.

Pendulum.—For a simple pendulum of length l, for a small amplitude, the complete period,

$$T = 2\pi\sqrt{\frac{l}{g}}\cdot \text{ or } g = 4\pi^2\,\frac{l}{T^2}.$$

T will be given in seconds if l is in cm and g in cm per sec^2.

For a sphere suspended by a wire of negligible mass where d is the distance from the knife edge to the center of the sphere whose radius is r, the length of the equivalent simple pendulum,

$$l = d + \frac{2r^2}{5d}.$$

If the period is P for an arc θ, the time of vibration in an infinitely small arc is approximately,

$$T = \frac{P}{1 + \frac{1}{4}\sin^2\frac{\theta}{4}}.$$

For a compound pendulum, if a body of mass m be suspended from a point about which its moment of inertia is I with its

center of gravity a distance h below the point of suspension, the period,

$$T = 2\pi\sqrt{\frac{I}{mgh}}.$$

Period in uniform circular motion is the time of one complete revolution. In any oscillatory motion it is the time of a complete oscillation. Dimension,— $[t]$.

Phase of oscillatory motion.—The fraction of a whole period which has elapsed since the moving particle last passed through its middle position in a positive direction.

Poisson's ratio is the ratio of the transverse contraction per unit dimension of a bar of uniform cross-section to its elongation per unit length, when subjected to a tensile stress.

Power.—The time rate at which work is done. Units of Power,—the watt, one joule (ten million ergs) per second; the kilowatt is equal to 1000 watts; the horse-power, 33,000 foot-pounds per minute, is equal to 746 watts. Dimensions,— $[m\ l^2\ t^{-3}]$.

If an amount of work W is done in time t the power or rate of doing work is,

$$P = \frac{W}{t}.$$

Power will be obtained in watts if W is expressed in joules (10^7 ergs) and t in sec.

Pressure.—Force applied to, or distributed, over a surface; measured as force per unit area. Cgs unit,—the barye, one dyne per square centimeter. The megabarye is equal to 10^6 dynes per square centimeter. Pressure is also measured by the height of the column of mercury or water which it supports. Dimensions,— $[m\ l^{-1}\ t^{-2}]$.

The pressure due to a force F distributed over an area A,

$$P = \frac{F}{A}.$$

Projectiles.—For bodies projected with velocity v at an angle a with the horizontal, the time to highest point of flight,

$$t = \frac{v \sin a}{g}.$$

Total time of flight,

$$T = \frac{2v \sin a}{g}.$$

Maximum height,

$$h = \frac{v^2 \sin^2 a}{2g}.$$

Horizontal range,

$$R = \frac{v^2 \sin 2a}{g}.$$

In the above equations the resistance of the air is neglected. g is the acceleration due to gravity.

Radius of gyration may be defined as the distance from the axis of rotation at which the total mass of a body might be concentrated without changing its moment of inertia. The product of total mass and the square of the radius of gyration will give moment of inertia.

Restitution, coefficient of, for two bodies on impact,—The ratio of the difference in velocity before impact to the difference after impact.

Sensitiveness of a balance.—Assuming the three knife edges of a balance to lie on a straight line,—if w is the weight of the beam, h the distance of the center of gravity below the knife edge, a the length of the balance arms and x a small mass added to one pan, the deflection θ produced is given by

$$\tan\theta = \frac{ax}{wh}.$$

Simple harmonic motion.—Periodic oscillatory motion in a straight line in which the restoring force is proportional to the displacement. If a point move uniformly in a circle, the motion of its projection on the diameter (or any straight line in the same plane) is simple harmonic motion.

If r is the radius of the reference circle, ω the angular velocity of the point in the circle, θ the angular displacement at the time t after the particle passes the mid-point of its path. the linear displacement,

$$x = r\sin\theta = r\sin\omega t.$$

The velocity at the same instant,

$$v = r\omega\cos\theta = \omega\sqrt{r^2 - x^2}.$$

The acceleration,

$$a = -\omega^2 x.$$

The force for a mass m,

$$F = -m\omega^2 x = -\frac{4\pi^2 mx}{T^2}.$$

The period,

$$T = 2\pi\sqrt{\frac{x}{a}}.$$

In the above equations the cgs system calls for x and r in cm, v in cm per sec, a in cm per sec^2, T in sec, m in grams, θ in radians, and ω in radians per sec.

Simple machine.—A contrivance for the transfer of energy and for increased convenience in the performance of work.

Mechanical advantage is the ratio of the resistance overcome to the force applied. Velocity ratio is the ratio of the distance through which force is applied to the distance through which resistance is overcome.

Efficiency is the ratio of the work done by a machine to the work done upon it.

If a force f applied to a machine through a distance S results in a force F exerted by the machine through a distance s, neglecting friction,

$$fS = Fs.$$

The theoretical mechanical advantage or velocity ratio in the above case is

$$\frac{S}{s}.$$

Actually the force obtained from the machine will have a smaller value than will satisfy the equation above. If F' be the actual force obtained, the practical mechanical advantage will be

$$\frac{F'}{f}.$$

The efficiency of the machine,

$$E = \frac{Fs'}{fS}.$$

Solid angle.—Measured by the ratio of the surface of the portion of a sphere enclosed by the conical surface forming the angle, to the square of the radius of the sphere. Unit of solid angle,—the steradian, the solid angle which encloses a surface on the sphere equivalent to the square of the radius. Dimensions,—unity.

Solubility of one liquid or solid in another is the mass of a substance contained in a solution which is in equilibrium with an excess of the substance. Under these conditions the solution is said to be saturated. Solubility of a gas is the ratio of concentration of gas in the solution to the concentration of gas above the solution.

Specific gravity.—The ratio of the mass of a body to the mass of an equal volume of water at 4°C or other specified temperature. Dimensions,—unity.

Specific volume is the reciprocal of density. Dimensions,—$[m^{-1}\ l^3]$.

Speed.—Time rate of motion measured by the distance moved over in unit time. Cgs unit,—one centimeter per second. Dimensions,—$[l\ t^{-1}]$.

Stokes' law gives the rate of fall of a small sphere in a viscous fluid. When a small sphere falls under the action of gravity through a viscous medium it ultimately acquires a constant velocity,

$$V = \frac{2ga^2(d_1 - d_2)}{9\eta}.$$

where a is the radius of the sphere, d_1 and d_2 the densities of the sphere and the medium respectively, and η the coefficient of

viscosity. V will be in cm^3 per sec if g is in cm per sec^2, a in cm, d_1 and d_2 in g per cm^3 and η in dyne-sec per cm^2 or poises.

Strain.—The deformation resulting from a stress measured by the ratio of the change to the total value of the dimension in which the change occurred. Dimensions,—unity.

Stress.—The force producing or tending to produce deformation in the body measured by the force applied per unit area. Cgs unit,—one dyne per square centimeter. Dimensions,—$[m\, l^{-1}\, t^{-2}]$.

Surface tension.—Two fluids in contact exhibit phenomena, due to molecular attractions, which appear to arise from a tension in the surface of separation. It may be expressed as dynes per cm or as ergs per square centimeter. Dimensions,—$[m\, t^{-2}]$.

The total force along a line of length l on the surface of a liquid whose surface tension is T,

$$F = l\,T.$$

Capillary tubes.—If a liquid of density d rises a height h in a tube of internal radius r the surface tension is,

$$T = \frac{rhdg}{2}.$$

The tension will be in dynes per cm if r and h are in cm, d in g per cm^3 and g in cm per sec^2.

Drops and bubbles.—Pressure in dynes per cm^2 due to surface tension on a drop of radius r cm for a liquid whose surface tension is T dynes per cm,

$$P = \frac{2T}{r}.$$

For a bubble of mean radius r cm, $P = \dfrac{4T}{r}$.

Time, unit of.—The second, 1/86400 of a mean solar day. One of the three fundamental units of the cgs system.

Torsional vibration.—*See* Angular harmonic motion.

Triangle or polygon of forces.—If three or more forces acting on the same point are in equilibrium, the vectors representing them form, when added, a closed figure.

Uniform circular motion.—If r is the radius of a circle, s the linear speed in the arc, ω the angular velocity and T the period or time of one revolution,

$$\omega = \frac{s}{r} = \frac{2\pi}{T}.$$

The acceleration toward the center is

$$a = \frac{s^2}{r} = \omega^2 r = \frac{4\pi^2 r}{T^2}.$$

The centrifugal force for a mass m,

$$F = \frac{ms^2}{r} = m\omega^2 r = \frac{4\pi^2 m r}{T^2}.$$

In the above equations ω will be in radians per second and a in cm per sec^2 if r is in cm, s in cm per sec and T in sec. F will be in dynes if mass is in grams and other units as above.

Application to the solar system.—If M is the mass of the sun, G the constant of gravitation, P the period of the planet, and r the distance of the planet from the sun, then the mass of the sun

$$M = \frac{4\pi^2 r^3}{GP^2} \quad (G = 6.657 \text{ for cgs units}).$$

If P is the period and r the distance of a satellite revolving around the planet, the above expression for M gives the mass of the planet. The formula is written on the assumption that the orbit of the planet or satellite is circular, which is only approximately true.

Uniformly accelerated rectilinear motion.—If v_0 is the initial velocity, v_t the velocity after time t, the acceleration,

$$a = \frac{v_t - v_0}{t}.$$

The velocity after time t,

$$v_t = v_0 + at.$$

Space passed over in time t,

$$s = v_0 t + \tfrac{1}{2}at^2.$$

Velocity after passing over space s,

$$v_s = \sqrt{v_0^2 + 2as}.$$

Space passed over in the nth second,

$$s = v_0 + \tfrac{1}{2}a(2n - 1).$$

In the above and following similar equations the values of the space, velocity, and acceleration must be substituted in the same system. For space in *cm*, velocity will be in *cm* per sec and acceleration in cm per sec per sec.

Unit.—A specific magnitude of a quantity, set apart by appropriate definition, which is to serve as a basis of comparison or measurement for other quantities of the same nature. *See* under the various physical quantities.

Vectors, composition of.—If the angle between two vectors is A, and their magnitude a and b, their resultant,

$$c = \sqrt{a^2 + b^2 + 2ab \cos A}.$$

Velocity.—Time rate of motion in a fixed direction. Cgs unit,—one centimeter per second. Dimensions,—$[l\ t^{-1}]$.

If s is space passed over in time t, the velocity,

$$v = \frac{s}{t}.$$

Velocity of efflux of a liquid.—If h is the distance from the opening to the free surface of the liquid, the velocity of efflux is

$$V = \sqrt{2gh}.$$

The above is the theoretical discharge velocity disregarding friction and the shape of orifice. For water issuing through a circular opening with sharp edges of area, A, the volume discharged per second is given approximately by,

$$Q = 0.62\ A\ \sqrt{2gh}.$$

Viscosity.—All fluids possess a definite resistance to change of form and many solids show a gradual yielding to forces tending to change their form. This property, a sort of internal friction, is called viscosity; it is expressed in dyne-seconds per cm^2 or poises. Dimensions,—$[m\ l^{-1}\ t^{-1}]$. If the tangential force per unit area, exerted by a layer of fluid upon one adjacent is one dyne for a space rate of variation of the tangential velocity of unity, the viscosity is one poise.

Kinematic viscosity is the ratio of viscosity to density.

Flow of liquids through a tube; where l is the length of the tube, r its radius, p the difference of pressure at the ends, η the coefficient of viscosity, the volume escaping per second,

$$v = \frac{\pi p r^4}{8 l \eta}\ \text{(Poiseuille.)}$$

The volume will be given in cm^3 per second if l and r are in cm, p in dynes per cm^2 and η in poises or dyne-seconds per cm^2.

Volume, unit of.—The cubic centimeter, the volume of a cube whose edges are one centimeter in length. Other units of volume are derived in a similar manner. Dimension,—$[l^3]$.

Weight.—The force with which a body is attracted toward the earth. Cgs unit,—the dyne. Dimensions,—$[m\ l\ t^{-2}]$.

Although the weight of a body varies with its location, the weights of various standards of mass are often used as units of force as,—pound weight, or pound force, gram weight, etc.

The weight of mass m, where g is the acceleration due to gravity,

$$W = mg.$$

The weight will be given in dynes when m is in grams and g in cm per sec^2.

Work.—When a force acts against resistance to produce motion in a body the force is said to do work. Work is measured by the product of the force acting and the distance moved through against the resistance. Cgs units of work,—the erg,

a force of one dyne acting through a distance of one centimeter. The joule is 1×10^7 ergs. Dimensions,— $[m\, l^2\, t^{-2}]$. The foot-pound is the work required to raise a mass of one pound a vertical distance of one foot where $g = 32.174$ ft./sec². The foot-poundal is the work done by a force of one poundal acting through a distance of one foot. The International joule, a unit of electrical energy, is the work expended per second by a current of one International ampere flowing through one International ohm. The kilowatt-hour is the total amount of energy developed in one hour by a power of one kilowatt.

If a force F act through a space s, the work done is

$$W = Fs.$$

Work will be given in ergs if F is in dynes and s in cm.

Work done in rotation. If a torque L dyne-cm acts through an angle θ radians, the work done in ergs is,

$$W = L\theta.$$

HEAT, RADIATION, PROPERTIES OF GASES

Absolute humidity.—Mass of water vapor present in the atmosphere measured as grams per cubic meter. It may also be expressed in terms of the actual pressure of the water vapor present.

Absolute temperature.—Temperature reckoned from the absolute zero. *See Temperature.*

Absolute zero.—The temperature at which a gas would show no pressure if the general law for gases should hold for all temperatures. It is equal to −273.18°C or −459.72°F.

Absorptive power or absorptivity for any body is measured by the fraction of the radiant energy falling upon the body which is absorbed or transformed into heat. This ratio varies with the character of the surface and the wave length of the incident energy. It is the ratio of the radiation absorbed by any substance to that absorbed under the same conditions by a black body.

Adiabatic.—A body is said to undergo an adiabatic change when its condition is altered without gain or loss of heat. The line on the pressure volume diagram representing the above change is called an adiabatic line.

Avogadro's law.—Equal volumes of different gases at the same pressure and temperature contain the same number of molecules.

Black body.—If, for all values of the wave length of the incident radiant energy, all of the energy is absorbed the body is called a black body.

Boyle's law for gases.—At a constant temperature the volume of a given quantity of any gas varies inversely as the pressure to which the gas is subjected.

For a perfect gas, changing from pressure p and volume v to pressure p' and volume v' without change of temperature,

$$pv = p'v'.$$

Charles' law for gases or Gay-Lussac's law.—At a constant pressure, the volume of a given quantity of any gas increases about 1/273 of its volume at 0°C for each rise of 1°C and at constant volume the pressure of a given quantity of any gas increases about 1/273 of the pressure at 0°C for each rise of 1°C in temperature.

Conductivity, thermal.—Time rate of transfer of heat by conduction, through unit thickness, across unit area for unit difference of temperature. It is measured as calories per second per square centimeter for a thickness of one centimeter and a difference of temperature of 1°C. Dimensions,—$[m\,l\,t^{-3}\,\theta^{-1}]$.

If the two opposite faces of a cube of a substance are maintained at temperatures t_1 and t_2, the heat conducted across the cube of section a and thickness d in a time T will be,

$$Q = K\frac{(t_2 - t_1)aT}{d}.$$

K is a constant depending on the nature of the substance, designated as the specific heat conductivity. K is usually given for Q in calories, t_1 and t_2 in °C, a in cm², T in sec, and d in cm. *See table* Heat conductivity.

Critical temperature is that temperature above which a gas cannot be liquefied by pressure alone. The pressure under which a substance may exist as a gas in equilibrium with the liquid at the critical temperature is the **critical pressure.**

Dalton's law of partial pressures.—The pressure exerted by a mixture of gases is equal to the sum of the separate pressures which each gas would exert if it alone occupied the whole volume. This fact is expressed in the following formula:

$$PV = V(p_1 + p_2 + p_3, \text{etc.})$$

Dew point.—The temperature at which condensation of water vapor in the air takes place.

Diffusivity of heat is given by Δ in the equation

$$\frac{dH}{dt} = -\Delta\, sd\, \frac{dT}{dx}\, dy\, dz$$

where dH is the quantity of heat passing through the area $dy\,dz$ in the direction of x in a time dt. The rate of variation of temperature along x is given by dT/dx, s is specific heat and d, density. Dimensions,—$[l^2\,t^{-1}]$.

Dulong and Petit's law of thermal capacity.—For simple substances the atoms all have approximately the same thermal capacity. The product of the specific heat by the atomic weight is a constant,—about 6.38.

Emissive power or emissivity is measured by the energy radiated from unit area of a surface in unit time for unit difference of temperature between the surface in question and surrounding bodies. For the cgs system the emissive power is given in ergs per second per square centimeter with the radiating surface at 1° absolute and the surroundings at absolute zero.

Entropy.—A quantity depending on the quantity of heat in a body and on its temperature, which, when multiplied by any lower temperature (minimum available), gives the unavailable energy, or unavoidable waste when mechanical work is derived from the heat energy of the body. Dimensions,— $[m\, l^2\, t^{-2}\, \theta^{-1}]$.

Expansion of gases.

Charles' law or Gay-Lussac's law.—The volume of a gas at constant pressure increases proportionately to the absolute temperature. If V_1 and V_2 are volumes of the same mass of gas at absolute temperatures, T_1 and T_2,

$$\frac{V_1}{V_2}=\frac{T_1}{T_2}.$$

For an original volume V_o at 0°C the volume at t°C (at constant pressure) is

$$V_t=V_o\ (1+0.00367t).$$

General law for gases.

$$p_t v_t = p_o v_o \left(1+\frac{t}{273}\right),$$

where p_o, v_o, p_t, v_t represent the pressure and volume at 0° and t°C.

The law may also be expressed

$$pv = RmT$$

where m is the mass of gas at absolute temperature T. R is the **gas constant** which depends on the units used. **Boltzmann's molecular gas constant** is obtained by expressing m in terms of the number of molecules.

For volume in cm^3, pressure in dynes per cm^2 and temperature in Centigrade degrees on the absolute scale $R=8.3136\times10^7$.

Reduction of a gas volume to 0°C, 760 mm pressure.—If V is the original volume of a gas at temperature t and pressure H the volume at 0°C and 760 mm pressure will be,

$$V_o=\frac{V}{(1+\alpha t)}\ \frac{H}{760}.$$

If d is the original density the density at 0°C and 760 mm pressure will be,

$$d_o = d(1 + at)\frac{760}{H}:$$

$$a = 0.00367 \text{ approximately.}$$

Gas thermometer.—Where P_o, P_s, and P_x represent the total pressures with the bulb at 0°C, at the boiling-point of water and at the unknown temperature respectively, t_s the temperature of steam and t_x the unknown temperature,

$$t_x = t_s\frac{P_x - P_o}{P_s - P_o}.$$

(approximately). The total pressure on the gas in the bulb is the sum of barometric pressure at the time and that measured by the manometer.

Heat equivalent, or latent heat, of fusion.—The quantity of heat necessary to change one gram of solid to a liquid with no temperature change. Dimensions,— $[l^2\ t^{-2}]$.

Heat quantity is measured by the change of temperature produced. The unit of heat is the **calorie**, the quantity of heat necessary to change the temperature of one gram of water from 3.5°C to 4.5°C (called a small calorie). If the temperature change involved is from 14.5 to 15.5°C, the unit is the normal calorie. The mean calorie is 1/100 the quantity of heat necessary to raise one gram of water from 0°C to 100°C. The large calorie is equal to 1000 small calories. The British thermal unit is the heat required to raise the temperature of one pound of water at its maximum density, 1°F. It is equal to 252 calories. Dimensions as of energy,— $[m\ l^2\ t^{-2}]$.

Intensity of radiation is the radiant energy emitted in a specified direction per unit time, per unit area of surface, per unit solid angle.

Isothermal.—When a gas passes through a series of pressure and volume variations without change of temperature the changes are called isothermal. A line on a pressure-volume diagram representing these changes is called an isothermal line.

Kinetic theory, expression for pressure.

$$P = \tfrac{1}{3} Nmv^2$$

where N is the number of molecules in unit volume, m the mass of each molecule and v^2 the mean square of the velocity of the molecules.

Latent heat of vaporization.—The quantity of heat necessary to change one gram of liquid to vapor without change of temperature. Both the above quantities are measured as calories per gram. Dimensions,— $[l^2\ t^{-2}]$.

Loschmidt's number.—The number of molecules per unit volume of an ideal gas at 0°C and normal atmospheric pressure. (n_o = 2.705 × 10^{19} per cm^3).

Mechanical equivalent of heat is the quantity of energy which, when transformed into heat, is equivalent to unit quantity of heat; 4.18×10^7 ergs = 1 calorie (20°C).

Monochromatic emissive power is the ratio of the energy of certain defined wave lengths radiated at definite temperatures to the energy of the same wave lengths radiated by a black body at the same temperature and under the same conditions.

Planck's constant (h) when multiplied by the frequency of radiation ν, gives the quantity of energy ($= h\nu$) contained in one quantum.

Radiance of a black body.—The hemispherical radiance of a black body of wave length λ is $I_\lambda \, d\lambda$. The hemispherical intensity,

$$I_\lambda = C_1 \lambda^{-5} \left[e^{(C_2/\lambda T)} - 1\right]^{-1}$$

where C_1 and C_2 are the first and second constants of radiation and T, the absolute temperature.

Radiation.—If I_0 is the intensity of normal radiation and I the intensity at an angle θ,

$$I = I_0 \cos \theta.$$

This is called Lambert's law. It does not apply in all cases.

Rankine scale of temperature.—The absolute Fahrenheit scale.

Relative humidity.—The ratio of the quantity of water vapor present in the atmosphere to the quantity which would saturate at the existing temperature. It is also the ratio of the pressure of water vapor present to the pressure of saturated water vapor at the same temperature.

Specific heat of a substance is the ratio of its thermal capacity to that of water at 15°C. Dimensions,—unity.

If a quantity of heat H calories is necessary to raise the temperature of m grams of a substance from t_1 to t_2°C, the specific heat, or more properly, thermal capacity of the substance,

$$s = \frac{H}{m\,(t_2 - t_1)}.$$

Specific heat by the method of mixtures.—Where a mass m_1 of the substance is heated to a temperature t_1, then placed in a mass of water m_2 at a temperature t_2 contained in a calorimeter with stirrer (of same material) of mass m_3, specific heat of the calorimeter c, t_3 the final temperature

$$m_1 \, s \, (t_1 - t_3) = (m_3 \, c + m_2)(t_3 - t_2).$$

Black's ice calorimeter.—If a body of mass m and temperature t melts a mass m' of ice, its temperature being reduced to 0°C, the specific heat of the substance is,

$$s = \frac{80.1 \, m'}{mt}.$$

Bunsen's ice calorimeter.—A body of mass m at temperature t causes a motion of the mercury column of l centimeters in a tube whose volume per unit length is v. The specific heat is

$$s = \frac{884\ lv}{mt}.$$

Stefan-Boltzman law of radiation.—The energy radiated in unit time by a black body is given by, $E = K(T^4 - T_o{}^4)$, where T is the absolute temperature of the body, T_0 the absolute temperature of the surroundings, and K a constant.

Temperature may be defined as the condition of a body which determines the transfer of heat to or from other bodies. The customary unit of temperature is the **Centigrade** degree, 1/100 the difference between the temperature of melting ice and that of water boiling under standard atmospheric pressure. The degree **Fahrenheit** is 1/180, and the degree **Reaumur** 1/80 the same difference of temperature.

The fundamental temperature scale is the absolute, thermodynamic or **Kelvin scale** in which the temperature measure is based on the average kinetic energy per molecule of a perfect gas. The zero of the Kelvin scale is -273.13°C. The temperature scale adopted by the International Bureau of Weights and Measures is that of the constant volume hydrogen gas thermometer. The magnitude of the degree in both these scales is defined as 1/100 the difference between the temperature of melting ice and that of boiling water at 760 mm pressure.

Thermal capacity of a substance is the quantity of heat necessary to produce unit change of temperature in unit mass. It is ordinarily expressed as calories per gram per degree Centigrade. Numerically equivalent to specific heat.

Thermal capacity or water equivalent.—The total quantity of heat necessary to raise any body or system unit temperature, measured as calories per degree centigrade in the cgs system. Dimension,—$[m]$.

Thermal expansion.—The coefficient of linear expansion or expansivity is the ratio of the change in length per degree to the length at 0°C. The coefficient of surface expansion is two times the linear coefficient. The coefficient of volume expansion (for solids) is three times the linear coefficient. The coefficient of volume expansion for liquids is the ratio of the change in volume per degree to the volume at 0°C. The value of the coefficient varies with temperature. The coefficient of volume expansion for a gas under constant pressure is nearly the same for all gases and temperatures and is equal to 0.00367 for 1°C. Dimension,—$[\theta^{-1}]$.

If l_0 is the length at 0°C, a the coefficient of linear expansion, the length at t_0 C is,

$$l_t = l_0\ (1 + at).$$

General formula for thermal expansion.—The rate of thermal expansion varies with the temperature. The general equation giving the magnitude m_t (length or volume) at a temperature t, where m_o is the magnitude at 0°C, is

$$m_t = m_o \ (1 + at + \beta t^2 + \gamma t^3 \ . \ . \ .)$$

where a, β, γ, etc., are empirically determined coefficients.

Volume expansion.—If V represents volume and β the coefficient of expansion,

$$V_t = V_o \ (1 + \beta t).$$

For solids,

$$\beta = 3a \text{ (approximately).}$$

Thermodynamics, laws of

I. When mechanical work is transformed into heat or heat into work the amount of work is always equivalent to the quantity of heat.

II. It is impossible by any continuous self-sustaining process for heat to be transferred from a colder to a hotter body.

Van der Waal's variation of Boyle's law.

$$(p + \frac{a}{v^2}) \ (v - b) = RT$$

where p and v are the pressure and volume at any constant temperature and a and b are constants. R is the gas constant and T the absolute temperature. For values of R, a and b see tables.

Wien's displacement law.—When the temperature of a radiating black body increases, the wave length corresponding to maximum energy decreases in such a way that the product of the absolute temperature and wave length is constant.

$$\lambda_{max} \ T = w$$

w is known as **Wien's displacement constant.**

WAVE MOTION AND SOUND

Air columns, frequency of vibration in.—*See* Organ pipes.

Beats.—Two tones of slightly different frequencies sounded together interfere to give a sound of regularly varying intensity. The number of beats per second is the difference in frequency of the two tones.

Doppler's principle.—The apparent frequency of a sound as

affected by motion of the hearer, the source and the medium is given by the following expression,

$$n = n_0 \frac{V + w - v_0}{V + w - v_s}.$$

where n_0 is the original frequency of the source, V the velocity of sound, w that of the medium, v_0 that of the observer and v_s that of the source. Only the components of motion parallel to the line connecting the source and observer are to be considered. All velocities are taken in the direction from source to observer; if the motion is in the opposite direction the sign of the velocity substituted in the formula should be changed.

Frequency of vibrating strings.—The fundamental frequency of a stretched string is given by

$$n = \frac{1}{2l}\sqrt{\frac{T}{m}}.$$

where l is the length; T, the tension and m the mass per unit length.

For a string of circular section of length l, tension T, density d, and radius r, the frequency of the fundamental is,

$$n = \frac{1}{2rl}\sqrt{\frac{T}{\pi d}}.$$

The frequency in vibrations per second will be given if T is in dynes, r and l in cm and d in g per cm³.

Intensity of sound depends upon the energy of the wave motion. The intensity is measured by the energy in ergs transmitted per second through one square centimeter of surface.

The energy in ergs per cm³ in a sound wave is given by

$$E = 2\pi^2 dn^2a^2$$

where d is density in g per cm³, n is frequency in vib. per sec and a is amplitude in cm. The energy reaching the ear in unit time will also be proportional to the velocity of propagation.

Lissajou's figures.—The path described by a particle which is simultaneously displaced by two simple harmonic motions at right angles, when the periods of the two motions are in the ratio of two small whole numbers, shows a variety of characteristic curves called Lissajou's figures.

Organ pipes.—The frequency of vibration of a closed pipe or other air column of length l, where V is the velocity of sound in air, for the fundamental and first three overtones respectively is,

$$n_0 = \frac{V}{4l}, n_1 = \frac{3V}{4l}, n_2 = \frac{5V}{4l}, n_3 = \frac{7V}{4l}.$$

For an open pipe,

$$n_0 = \frac{V}{2l}, n_1 = \frac{2V}{2l}, n_2 = \frac{3V}{2l}, n_3 = \frac{4V}{2l}.$$

Pitch of sound is determined by the frequency or number of vibrations per second.

Quality or timbre of a sound depends on the coexistence with the fundamental of other vibrations of various frequencies and amplitudes.

Stationary or standing waves are produced in a medium by the simultaneous transmission, in opposite directions of two similar wave motions. Fixed points of minimum amplitude are called **nodes.** A **segment** extends from one node to the next. An **antinode** or **loop** is the point of maximum amplitude between two nodes.

Velocity of a compressional wave.—The velocity of a compressional wave in an elastic medium, in terms of elasticity E (bulk modulus) and density d,

$$V = \sqrt{\frac{E}{d}}.$$

For the velocity of sound in air, where p is the pressure and d the density,

$$V = \sqrt{\frac{p}{d}1.4}$$

Velocity of a transverse wave in a stretched cord. If T is the tension of the cord and m the mass per unit length.

$$V = \sqrt{\frac{T}{m}}.$$

Velocity of a wave.—The velocity of propagation in terms of wave length λ and period T or frequency n is,

$$V = \frac{\lambda}{T} = n\lambda.$$

Velocity of sound, variation with temperature.—The velocity in meters per sec at any temperature t in °C is given approximately by,

$$V = V_o \sqrt{1 + \frac{t}{273}}.$$

$$V = 331.5 + .607t.$$

The **variation with humidity** is given by the equation

$$V_d = V_h \sqrt{1 - \frac{e}{p}\left(\frac{\gamma_w}{\gamma_a} - \frac{5}{8}\right)}.$$

where V_d is the velocity in dry air, V_h that in air at barometric pressure p in which the pressure of water vapor is e. γ_w and γ_a are the specific heat ratios for water vapor and for air respectively.

Velocity of water waves.—If the depth h is small compared with the wave length, the velocity,

$$V = \sqrt{gh}.$$

In deep water for a wave length λ,

$$V = \sqrt{\frac{g\lambda}{2\pi}}.$$

If the wave length is very small, less than about 1.6 cm, the velocity increases as the wave length decreases and is expressed by the following,

$$V = \sqrt{\frac{2\pi T}{\lambda d} + \frac{g\lambda}{2\pi}}.$$

where T is the surface tension and d the density of the liquid. V will be given in cm per sec if h and λ are in cm, g in cm per sec^2, T in dynes per cm and d in g per cm^3.

Wave motion.—A progressive disturbance propagated in a medium by the periodic vibration of the particles of the medium. Transverse wave motion is that in which the vibration of the particles is perpendicular to the direction of propagation. Longitudinal wave motion is that in which the vibration of the particles is parallel to the direction of propagation.

ELECTRICITY AND MAGNETISM

Alternating current in circuits including resistance and inductance,

$$I = \frac{E}{\sqrt{R^2 + (2\pi n L)^2}}$$

where n is the frequency in cycles per second, L the inductance in henry. I will be given in virtual amperes if R is in ohms and E in virtual volts. The denominator is known as the impedance of the circuit.

For circuits also involving a capacity C in farads, the impedance becomes,

$$\sqrt{R^2 + \left(2\pi n L - \frac{1}{2\pi n C}\right)^2}$$

Capacity is measured by the charge which must be communicated to a body to raise its potential one unit. Electrostatic unit capacity is that which requires one electrostatic unit of charge to raise its potential one electrostatic unit. The farad = 9×10^{11} electrostatic units. A capacity of one farad requires one coulomb of electricity to raise its potential one volt. Dimensions,— $[\epsilon l]$; $[\mu^{-1} l^{-1} t^2]$.

A conductor charged with a quantity q to a potential V has a capacity,

$$C = \frac{q}{V}.$$

Capacity of a spherical conductor of radius r,

$$C = Kr.$$

Capacity of two concentric spheres of radii r and r',

$$C = K\frac{rr'}{r - r'},$$

Capacity of a parallel plate condenser, the area of whose plates is A and the distance between them d,

$$C = \frac{KA}{4\pi d}.$$

Capacities will be given in electrostatic units if the dimensions of condensers are substituted in cm.

Condensers in parallel and series.—If c_1, c_2, c_3, etc., represent the capacities of a series of conductors and C their combined capacity,—

when in parallel, $C = c_1 + c_2 + c_3 \ldots,$

when in series $\frac{1}{C} = \frac{1}{c_1} + \frac{1}{c_2} + \frac{1}{c_3} \ldots.$

Conductance, the reciprocal of resistance, is measured by the ratio of the current flowing through a conductor to the difference of potential between its ends. The practical unit of conductance, the mho, is the conductance of a body through which one ampere of current flows when the potential difference is one volt. The conductance of a body in mho is the reciprocal of the value of its resistance in ohms. Dimensions,— $[\epsilon\, l\, t^{-1}]$; $[\mu^{-1}\, l^{-1}\, t]$.

Conductivity is measured by the quantity of electricity transferred across unit area, per unit potential gradient per unit time. Reciprocal of resistivity. **Volume conductivity** or specific conductance, $k = 1/\rho$ where ρ is the volume resistivity. **Mass conductivity** $= k/d$ where d is density. **Equivalent conductivity** $\Lambda = k/c$ where c is the number of equivalents per unit volume of solution. **Molecular conductivity** $\mu = k/m$ where m is the number of moles per unit volume of solution. Dimensions: volume conductivity,— $[\epsilon t^{-1}]$; $[\mu^{-1}\, l^{-2}\, t]$,—mass conductivity,— $[\epsilon\, m^{-1}\, l^3\, t^{-1}]$; $[\mu^{-1}\, m^{-1}\, lt]$.

Conductors.—A class of bodies which are incapable of supporting electric strain. A charge given to a conductor spreads to all parts of the body.

Couple acting on a magnet of magnetic moment ml in a field

of strength H. If the magnet is perpendicular to the direction of the field,

$$C = Hml = HM.$$

If the angle between the magnet and the field is θ,

$$C = Hml \sin \theta.$$

The couple will be in dyne-cm for cgs units of H, m and l.

Current (electric).—The rate of transfer of electricity. The transfer at the rate of one electrostatic unit of electricity in one second is the electrostatic unit of current. The electromagnetic unit of current is a current of such strength that one centimeter of the wire in which it flows is pushed sideways with a force of one dyne when the wire is at right angles to a magnetic field of unit intensity. The practical unit of current is the **ampere,** a transfer of one coulomb per second, which is one tenth the electromagnetic unit. The **international ampere** is the unvarying electric current which when passed through a solution of silver nitrate in accordance with certain specifications, deposits silver at the rate of 0.00111800 gram per second. The international ampere is equivalent to 0.99991 absolute ampere. The **ampere-turn** is the magnetic potential produced between the two faces of a coil of one turn carrying one ampere. Dimensions,— $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}t^{-2}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$.

Current in a simple circuit.—The current in a circuit including an external resistance R and a cell of electromotive force E, and internal resistance r,

$$i = \frac{E}{R+r}.$$

If E is in volts and r and R in ohms the current will be in amperes.

For two cells in parallel,

$$i = \frac{E}{R+\frac{r}{2}}.$$

For two cells in series,

$$i = \frac{2E}{R+2r}.$$

Declination.—The angle between the vertical plane containing the direction of the earth's field at any point and a plane containing the geographic north and south meridian.

Diamagnetic bodies tend to set the longest dimension across the magnetic field. The permeability of a diamagnetic substance is less than unity.

Dielectric constant of a medium is defined by ϵ in the equation

$$f = \frac{qq'}{\epsilon r^2}.$$

where f is the force of attraction between two charges q and q' separated by a distance r in a uniform medium.

Dielectrics or insulators or non-conductors.—A class of bodies supporting an electric strain. A charge on one part of a non-conductor is not communicated to any other part.

Dip.—The angle measured in a vertical plane between the direction of the earth's magnetic field and the horizontal.

Electric field intensity is measured by the force exerted on unit charge. Unit field intensity is the field which exerts the force of one dyne on unit positive charge. Dimensions,—$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2}]$.

The field intensity or force exerted on unit charge at a point distant r from a charge q in a vacuum.

$$H = \frac{q}{r^2}.$$

If the dielectric in the above cases is not a vacuum the dielectric constant ϵ must be introduced. The formulae become,

$$F = \frac{qq'}{\epsilon r^2}. \qquad H = \frac{q}{\epsilon r^2}.$$

The value of ϵ is frequently considered unity for air. If the dielectric constant of a vacuum is considered unity the value for air at 0°C and 760 mm pressure is 1.000576.

Electrolysis.—If a current i flows for a time t and deposits a metal whose electrochemical equivalent is e, the mass deposited is

$$m = eit.$$

The value of e is usually given for mass in grams, i in amperes and t in seconds.

Electromotive force is defined as that which causes a flow of current. The electromotive force of a cell is measured by the maximum difference of potential between its plates. The electromagnetic unit of potential difference is that against which one erg of work is done in the transfer of electromagnetic unit quantity. The **volt** is that potential difference against which one joule of work is done in the transfer of one coulomb. One volt is equivalent to 10^8 electromagnetic units of potential. The **international** volt is the electrical potential which when steadily applied to a conductor whose resistance is one international ohm will cause a current of one international ampere to flow. The international volt = 1.00043 absolute volts. The electromotive force of a Weston standard cell is 1.0183 at 20°C. Dimensions,—$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{3}{2}} t^{-2}]$.

Electron.—Considered to be the ultimate indivisible negative charge which with the **proton** or positive charge constitutes the basic elements in the formation of atoms. The electronic ratio is the ratio of the charge of an electron to its mass.

Energy of a charge in ergs where Q is the charge and V the potential in electrostatic units.

$$E = \tfrac{1}{2}QV.$$

Energy of the electric field.—If H is the electric field intensity in electrostatic units and K the specific inductive capacity, the energy of the field in ergs per cm³ is,

$$E = \frac{KH^2}{8\pi}.$$

Faraday's law.—The mass of substance decomposed by the passage of equal quantities of electricity through different electrolytic cells are, for the same electrolyte, equal, and for different electrolytes are proportional to the combining weights of the elements or radicals which are deposited.

Force between two charges.—If two charges q and q' are at a distance r in a vacuum, the force between them is,

$$F = \frac{qq'}{r^2}.$$

The force will be given in dynes if q and q' are in electrostatic units and r in cm.

Force between two magnetic poles.—If two poles of strength m and m' are separated by a distance r in a medium whose permeability is μ (unity for a vacuum), the force between them is,

$$F = \frac{mm'}{\mu r^2}.$$

Force will be given in dynes if r is in cm and m and m' are in cgs units of pole strength.

The strength of a magnetic field at a point distant r from an isolated pole of strength m is,

$$H = \frac{m}{\mu r^2}.$$

The field will be given in gauss if m and r are in cgs units.

Heat effect.—The heat in calories developed in a circuit by an electric current of i amperes flowing through a resistance of r ohms, with a difference of potential E volts for a time t seconds,

$$H = \frac{ri^2t}{4.18} = \frac{Eit}{4.18}.$$

Hysteresis.—The magnetization of a sample of iron or steel due to a magnetic field which is made to vary through a cycle of values, lags behind the field. This phenomenon is called hysteresis.

Steinmetz' equation for hysteresis gives the loss of energy in ergs per cycle per cm³,

$$W = \eta B^{1.6}$$

where B is the maximum induction in maxwells per cm² and η the coefficient of hysteresis.

Induced electromotive force in a circuit is proportional to the rate of change of magnetic flux through the circuit.

$$E = -\frac{d\phi}{dt}.$$

where $d\phi$ is the change of magnetic flux in a time dt. The induced current will be given by

$$I = \frac{d\phi}{Rdt}.$$

where R is the resistance of the circuit.

Inductance.—The change in magnetic field due to the variation of a current in a conducting circuit causes an induced electromotive force in the circuit itself. This phenomenon is known as self-induction. If an electromotive force is induced in a neighboring circuit the term mutual induction is used. Inductance may thus be distinguished as self- or mutual and is measured by the electromotive force produced in a conductor by unit rate of variation of the current. Units of inductance are the centimeter (absolute electromagnetic) and the henry, which is equal to 10^9 centimeters of inductance. The **henry** is that inductance in which an induced electromotive force of one volt is produced when the inducing current is changed at the rate of one ampere per second. Dimensions,— $[\epsilon^{-1} l^{-1} t^2]$; $[\mu\, l]$.

Induction.—Any change in the intensity or direction of a magnetic field causes an electromotive force in any conductor in the field. The induced electromotive force generates an induced current if the conductor forms a closed circuit.

Intensity of magnetization is given by the quotient of the magnetic moment of a magnet by its volume. Unit intensity of magnetization is the intensity of a magnet which has unit magnetic moment per cubic centimeter. Dimensions,— $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{3}{2}}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$.

Kirchoff's laws.

I. The algebraic sum of the currents which meet at any point is zero.

II. In any closed circuit the algebraic sum of the products of the current and the resistance in each conductor in the circuit is equal to the electromotive force in the circuit.

Lenz' law.—When an electromotive force is induced in a conductor by any change in the relation between the conductor and the magnetic field, the direction of the electromotive force is such as to produce a current whose magnetic field will oppose the change.

Line of force.—A term employed in the description of an electric or magnetic field. A line such that its direction at

every point is the same as the direction of the force which would act on a small positive charge (or pole) placed at that point. A line of force is defined as starting from a positive charge (or pole) and ending on a negative charge (or pole).

The line (of force) is also used as a unit of magnetic flux, equivalent to the maxwell.

Magnetic field due to a current.—The intensity of the magnetic field in gauss at the center of a circular conductor of radius r in which a current i in absolute electromagnetic units is flowing,

$$H=\frac{2\pi i}{r}.$$

If the circular coil has n turns the magnetic intensity at the center is,

$$H=\frac{2\pi n i}{r}.$$

The magnetic field in a long solenoid of n turns per centimeter carrying a current i in absolute electromagnetic units,

$$H=4\pi n i.$$

If i is given in amperes the above formulae become,—

$$H=\frac{2\pi i}{10r} \quad H=\frac{2\pi n i}{10r}, \quad H=\frac{4\pi n i}{10}.$$

Magnetic field due to a magnet.—At a point on the magnetic axis prolonged, at a distance r cm from the center of the magnet of length $2l$ whose poles are $+m$ and $-m$ and magnetic moment M, the field strength in gauss is,

$$H=\frac{4mlr}{(r^2-l^2)^2}.$$

If r is large compared with l,

$$H=\frac{2M}{r^3}.$$

At a point on a line bisecting the magnet at right angles, with corresponding symbols,

$$H=\frac{2ml}{(r^2+l^2)^{\frac{3}{2}}}.$$

For large values of r,

$$H=\frac{M}{r^3}.$$

Magnetic field intensity or magnetizing force is measured by the force acting on unit pole. Unit field intensity, the **gauss,** is that field which exerts a force of one dyne on unit magnetic pole. The field intensity is also specified by the number of lines of force intersecting unit area normal to the field, equal numerically to the field strength in gauss. Magnetizing force

is measured by the space rate of variation of magnetic potential and as such its unit may be the **gilbert per centimeter.** The gamma, (γ) is equivalent to 0.00001 gauss. Dimensions,—$[\epsilon^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2}]$; $[\mu^{-\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$.

Magnetic flux through any area perpendicular to a magnetic field is measured as the product of the area by the field strength. The unit of magnetic flux, the **maxwell** is the flux through a square centimeter normal to a field of one gauss. The line is also a unit of flux. It is equivalent to the maxwell. Dimensions,—$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{3}{2}} t^{-1}]$.

Magnetic induction resulting when any substance is subjected to a magnetic field is measured as the magnetic flux per unit area taken perpendicular to the direction of the flux. The unit is the maxwell per square centimeter or its equivalent, the gauss. Dimensions,—$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{3}{2}}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$.

If a substance of permeability μ is placed in a magnetic field H the magnetic induction in the substance,

$$B = \mu H.$$

If I is the magnetic moment for unit volume, or intensity of magnetization,

$$B = H + 4\pi I.$$

The susceptibility,

$$K = \frac{I}{H}, \quad \mu = 1 + 4\pi K.$$

Magnetic moment of a magnet is measured by the torque experienced when it is at right angles to a uniform field of unit intensity. The value of the magnetic moment is given by the product of the magnetic pole strength by the distance between the poles. Unit magnetic moment is that possessed by a magnet formed by two poles of opposite sign and of unit strength, one centimeter apart. Dimensions,—$[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{5}{2}} t^{-1}]$; $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{3}{2}}]$.

If the poles are separated by a distance which is great compared with the dimensions of the magnet, the magnetic moment of a magnet of length l whose poles have values of $+m$ and $-m$ is,

$$M = ml.$$

Magnetic permeability is a property of materials modifying the action of magnetic poles placed therein and modifying the magnetic induction resulting when the material is subjected to a magnetic field or magnetizing force. The permeability of a substance may be defined as the ratio of the magnetic induction in the substance to the magnetizing field to which it is subjected. The permeability of a vacuum is unity. Dimensions,—$[\epsilon^{-1} l^{-2} t^{2}]$; $[\mu]$.

Magnetic pole or quantity of magnetism.—Two unit quantities of magnetism concentrated at points unit distance apart in

a vacuum repel each other with unit force. If the distance involved is one centimeter and the force one dyne, the quantity of magnetism at each point is one cgs unit of magnetism. Dimensions,— $[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{3}{2}}\, t^{-1}]$.

Magnetic potential or magnetomotive force at a point is measured by the work required to bring unit positive pole from an infinite distance (zero potential) to the point. The unit is the **gilbert**, that magnetic potential against which an erg of work is done when unit magnetic pole is transferred. Dimensions,— $[\epsilon^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{3}{2}}\, t^{-2}]$; $[\mu^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-1}]$.

Ohm's law.—Current in terms of electromotive force E and resistance R,

$$i = \frac{E}{R}.$$

The current is given in amperes when E is in volts and R in ohms.

Paramagnetic bodies are those which tend to set the longest dimension parallel to the magnetic field. The permeability of a paramagnetic substance is greater than unity.

Permeance, the reciprocal of reluctance. Unit permeance is the permeance of a cylinder one square centimeter cross-section and one centimeter length taken in a vacuum. Dimensions,— $[\epsilon^{-1}\, l^{-1}\, t^{2}]$; $[\mu\, l]$.

Period of vibration of a magnet of magnetic moment M and moment of inertia I vibrating in a field of strength H,

$$T = 2\pi \sqrt{\frac{I}{MH}}.$$

Potential (electric) at any point is measured by the work necessary to bring unit positive charge from an infinite distance. Difference of potential between two points is measured by the work necessary to carry unit positive charge from one to the other. If the work involved is one erg we have the electrostatic unit of potential. Dimensions,— $[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-1}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{3}{2}}\, t^{-2}]$.

The potential at a point due to a charge q at a distance r in a medium whose dielectric constant is ϵ is,

$$V = \frac{q}{\epsilon r}.$$

Power developed by a current.—The power in watts developed by an electric current flowing in a conductor, where E is the difference of potential at its terminals in volts, r its resistance in ohms, and i the current in amperes,

$$P = Ei = ri^2.$$

The work done in joules in a time t sec is,

$$W = Eit : ri^2t.$$

Power in watts for alternating current in a circuit,

$$P = EI \cos \phi$$

where E and I are the effective values of the electromotive force and current in volts and amperes respectively and ϕ the phase angle between the current and the impressed electromotive force.

The ratio,

$$\frac{P}{EI} = \cos \phi$$

is called the power factor.

Power ratios in telephone engineering are measured in **decibels.** The gain or loss of power expressed in decibels is ten times the logarithm of the power ratio. By reference to an arbitrarily chosen "power level" the actual power may be expressed in decibels. The numerical values thus used will not be proportional to the actual power level but roughly to the sensation on the ear produced when the electrical power is converted into sound. A difference of 1 decibel in the power supply to a telephone receiver produces approximately the smallest change in volume of sound which a normal ear can detect.

Quantity of electricity or charge.—The electrostatic unit of charge, the quantity which, when concentrated at a point and placed at unit distance from an equal and similarly concentrated quantity, is repelled with unit force. If the distance is one centimeter and the force of repulsion one dyne and the surrounding medium a vacuum, we have the electrostatic unit of quantity. The electromagnetic unit of quantity may be defined as that transferred by unit current in unit time. The quantity transferred by one ampere in one second is the **coulomb,** the practical unit. The **faraday** is the electrical charge carried by one gram equivalent. The coulomb $= 3 \times 10^9$ electrostatic units. Dimensions,— $[\epsilon^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}\ t^{-1}]$; $[\mu^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}]$.

Reluctance is that property of a magnetic circuit which determines the total magnetic flux in the circuit when a given magnetomotive force is applied. Unit, the **oersted** the reluctance of one centimeter length and one square centimeter cross-section of space taken in a vacuum. Dimensions,— $[\epsilon\ l\ t^{-2}]$; $[\mu^{-1}\ l^{-1}]$.

Reluctivity or specific reluctance is the reciprocal of magnetic permeability. The reluctivity of empty space is taken as unity. Dimensions,— $[\epsilon\ l^2\ t^{-2}]$; $[\mu^{-1}]$.

Resistance is a property of conductors depending on their dimensions, material and temperature which determines the current produced by a given difference of potential. The practical unit of resistance, the **ohm** is that resistance through which a difference of potential of one volt will produce a current of one ampere. The **international ohm** is the resistance offered to an

unvarying current by a column of mercury at 0°C, 14.4521 grams in mass, of constant cross-sectional area and 106.300 centimeters in length, sometimes called the legal ohm. Dimensions,—$[\epsilon^{-1}\, l^{-1}\, t]$; $[\mu\, l\, t^{-1}]$.

Resistance of a conductor at 0°C, of length l, cross-section s and specific resistance ρ.

$$R_o = \rho \frac{l}{s}.$$

The resistivity may be expressed as ohm-cm when R is in ohms, l in cm and s in cm^2.

Resistance of a conductor at a temperature t whose resistance at 0°C is R_o and whose temperature resistance coefficient is a,

$$R_t = R_o\ (1 + at).$$

Resistance of conductors in series and parallel.—The total resistance of any number of resistances joined in series is the sum of the separate resistances. The total resistance of conductors in parallel whose separate resistances are $r_1, r_2, r_3, \ldots r_n$ is given by the formula

$$\frac{1}{R} = \frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3} \ldots + \frac{1}{r_n}.$$

R is the total resistance.

For two terms this becomes,

$$R = \frac{r_1 r_2}{r_1 + r_2}.$$

Resistivity or specific resistance, the reciprocal of conductivity, is measured by the resistance of a body of the substance of unit cross-section and of unit length at 0°C also called volume resistivity. The unit may be indicated as the ohm-centimeter. Dimensions,—$[\epsilon^{-1}\, t]$; $[\mu\, l^2\, t^{-1}]$.

Mass resistivity is the longitudinal resistance per unit length of a uniform bar of the substance of such a sectional area that it contains one unit of mass per unit of length. Dimensions,—$[\epsilon^{-1}\, m\, l^{-3}\, t]$; $[\mu\, m\, l^{-1}\, t^{-1}]$.

Surface resistivity is the resistance of unit length and unit width of a surface.

Surface density of electricity.—Quantity of electricity per unit area. Dimensions,—$[\epsilon^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$; $[\mu^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{3}{2}}]$.

Surface density of magnetism.—Quantity of magnetism per unit area. Dimensions,—$[\epsilon^{-1}\, m^{\frac{1}{2}}\, l^{-\frac{3}{2}}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^{-1}]$.

Specific inductive capacity.—The ratio of the capacity of a condenser with a given substance as dielectric to the capacity of the same condenser with air or a vacuum as dielectric is called the specific inductive capacity. The ratio of the dielectric constant of a substance to that of a vacuum.

Susceptibility (**magnetic**) is measured by the ratio of the in-

tensity of magnetization produced in a substance to the magnetizing force or intensity of field to which it is subjected. The susceptibility of a substance will be unity when unit intensity of magnetization is produced by a field of one gauss. Dimensions,—$[\epsilon^{-1} l^{-2} t^2]$; $[\mu]$.

Tangent galvanometer.—A tangent galvanometer with n turns, of radius r, in the earth's field H, has a deflection θ, The current flowing is,

$$i = \frac{Hr}{2\pi n} \tan \theta.$$

If $\frac{2\pi n}{r} = G$ (the galvanometer constant),

$$i = \frac{H}{G} \tan \theta.$$

Temperature resistance coefficient.—The ratio of the change of resistance in a wire due to a change of temperature of 1°C to its resistance at 0°C. Dimension,—$[\theta^{-1}]$.

Thermoelectric power is measured by the electromotive force produced by a thermocouple for unit difference of temperature between the two junctions. It varies with the average temperature and is usually expressed in microvolts per degree C. It is customary to list the thermoelectric power of the various metals with respect to lead. Dimensions,—$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1} \theta^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} t^{-2} \theta^{-1}]$.

Thomson thermoelectric effect is the designation of the potential gradient along a conductor which accompanies a temperature gradient. The magnitude and direction of the potential varies with the substance.

The coefficient of the Thomson effect or specific heat of electricity is expressed in joules per coulomb per degree Centigrade. Dimensions,—$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1} \theta^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2} \theta^{-1}]$.

Torque produced by the action of one magnet on another.—The turning moment experienced by a magnet of pole strength m' and length $2l'$ placed at a distance r from another magnet of length $2l$ and pole strength m, where the center of the first magnet is on the axis (extended) of the second and the axis of the first is perpendicular to the axis of the second,

$$C = 8\frac{mm'll'}{r^3} = \frac{2MM'}{r^3}.$$

If the first magnet is deflected through an angle θ, the expression becomes,

$$C = \frac{2MM'}{r^3} \cos \theta.$$

Tractive force of a magnet.—If a magnet with induction B has a pole face of area A the force is,

$$F = \frac{B^2 A}{8\pi}.$$

If B and A are in cgs units, A will be in dynes.

Wheatstone's bridge.—If the resistances r_1, r_2, r_3, and r_4 form the arms of a Wheatstone's bridge in order as the circuit (omitting cell and galvanometer connections) is traced, when the bridge is balanced,

$$\frac{r_1}{r_2} = \frac{r_4}{r_3} \text{ or } \frac{r_1}{r_4} = \frac{r_2}{r_3}.$$

LIGHT

Absorption, Lambert's law.—If I_o is the original intensity, I the intensity after passing through a thickness x of a material whose absorption coefficient is k,

$$I = I_o e^{-kx}.$$

The **index of absorption** k' is given by the relation $k = (4\pi k'n)/\lambda$ where n is the index of refraction and λ the wave length in vacuo. The **mass absorption** is given by k/d where d is the density. The **transmission factor** is given by I/I_o.

Achromatic.—A term applied to lenses signifying their more or less complete correction for chromatic aberration.

Angular aperture of an objective is the largest angular extent of wave surface which it can transmit.

Apochromat.—A term applied to photographic and microscope objectives indicating the highest degree of color correction.

Astigmatism is an error of spherical lenses peculiar to the formation of images by oblique pencils. The image of a point when astigmatism is present will consist of two focal lines at right angles to each other and separated by a measurable distance along the axis of the pencil. The error is not eliminated by reduction of aperture as is spherical aberration.

Brewster's law.—The tangent of the polarizing angle for a substance is equal to the index of refraction. The polarizing angle is that angle of incidence for which the reflected polarized ray is at right angles to the refracted ray.

Brightness is measured by the flux emitted per unit emissive area as projected on a plane normal to the line of sight. The unit of brightness is that of a perfectly diffusing surface giving out one lumen per square centimeter of projected surface and is called the lambert. The millilambert (0.001 lambert) is a more convenient unit. **Candle per square centimeter** is the brightness of a surface which has, in the direction considered, a luminous intensity of one candle per cm^2.

Chromatic aberration.—Due to the difference in the index of refraction for different wave lengths, light of various wave lengths from the same source cannot be focused at a point by a simple lens. This is called chromatic aberration.

Coma.—An aberration of lenses, occurring in the case of oblique, incidence, similar to spherical aberration of the axial rays. The image of a point is comet shaped, hence the name.

Conjugate foci.—Under proper conditions light divergent from a point on or near the axis of a lens or spherical mirror is focused at another point. The point of convergence and the position of the source are interchangeable and are called conjugate foci.

Diffraction.—If the light source were a point, the shadow of any object would have its maximum sharpness; a certain amount of illumination, however, would be found within the geometrical shadow due to the diffraction of the light at the edge of the object.

Diffraction grating.—If s is the distance between the rulings, d the angle of diffraction, then the wave length where the angle of incidence is 90° is (for the nth order spectrum),

$$\lambda = \frac{s \sin d}{n}.$$

If i is the angle of incidence, d the angle of diffraction, s the distance between the rulings, n the order of the spectrum, the wave length is,

$$\lambda = \frac{s}{n}(\sin i + \sin d).$$

Dispersion.—The difference between the index of refraction of any substance for any two wave lengths is a measure of the dispersion for these wave lengths, called the coefficient of dispersion.

Dispersive power.—If n_1 and n_2 are the indices of refraction for wave lengths λ_1 and λ_2 and n the mean index or that for sodium light, the dispersive power for the specified wave lengths is,

$$\omega = \frac{n_2 - n_1}{n - 1}.$$

Illumination on any surface is measured by the luminous flux incident on unit area. The units in use are: the **lux**, one lumen per square meter; the **phot**, one lumen per square centimeter and the lumen per square foot. Since at unit distance from a point source of unit intensity the illumination is unity, unit illumination may be defined as that produced by unit source at unit distance, hence the **meter-candle** or **candle-meter** which is equal to the lux and the **foot-candle** equivalent to one lumen per square foot.

Index of refraction for any substance is the ratio of the velocity of light in a vacuum to its velocity in the substance. It is also the ratio of the sine of the angle of incidence to the sine of the angle of refraction. In general, the index of refraction

for any substance varies with the wave length of the refracted light.

Intensity of illumination in candle meters of a screen illuminated by a source of illuminating power P candles at a distance r meters, for normal incidence,

$$I = \frac{P}{r^2}.$$

If two sources of illuminating power P_1 and P_2 produce equal illumination on a screen when at distances r_1 and r_2 respectively,

$$\frac{P_1}{r_1^2} = \frac{P_2}{r_2^2} \text{ or } \frac{P_1}{P_2} = \frac{r_1^2}{r_2^2}.$$

If I_o is the intensity of illumination when the screen is normal to the incident light, I the intensity when at an angle θ,

$$I = I_o \cos \theta.$$

Lambert's law.—When light is normally incident on a perfectly diffusing surface the intensity of the reflected light is proportional to the cosine of the angle made with the normal.

Lenses.—For a single thin lens whose surfaces have radii of curvature r_1 and r_2, whose principal focus is F, the index of refraction n, and conjugate focal distances f_1 and f_2,

$$\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} = (n-1)\left(\frac{1}{r_1} + \frac{1}{r_2}\right).$$

For a thick lens, of thickness t,

$$F = \frac{n r_1 r_2}{(n-1)\,[n(r_1+r_2) - t(n-1)]}.$$

Combinations of lenses,—If f_1 and f_2 are the focal lengths of two thin lenses separated by a distance d the focal length of the system,

$$F = \frac{f_1 f_2}{f_1 + f_2 - d}.$$

Luminous intensity or candle-power is the property of a source of emitting luminous flux and may be measured by the luminous flux emitted per unit solid angle. The accepted unit of luminous intensity is the **international candle.** The **hefner unit,** which is equivalent to 0.9 international candles, is the intensity of a lamp of specified design burning amyl acetate, called the Hefner lamp.

The mean horizontal candle-power is the average intensity measured in a horizontal plane passing through the source. The mean spherical candle-power is the average candle-power measured in all directions and is equal to the total luminous flux in lumens divided by 4π.

Luminous flux.—The total visible energy emitted by a source

per unit time is called the total luminous flux from the source. The unit of flux, the **lumen**, is the flux emitted in unit solid angle (steradian) by a point source of one candle luminous intensity. A uniform point source of one candle intensity thus emits 4π lumens.

Magnifying power of an optical instrument is the ratio of the angle subtended by the image of the object seen through the instrument to the angle subtended by the object when seen by the unaided eye. In the case of the microscope or simple magnifier the object as viewed by the unaided eye is supposed to be at a distance of 25 cms (10 in.).

Minimum deviation.—The deviation or change of direction of light passing through a prism is a minimum when the angle of incidence is equal to the angle of emergence. If D is the angle of minimum deviation and A the angle of the prism, the index of refraction of the prism for the wave length used is,

$$n = \frac{\sin \frac{1}{2} (A + D)}{\sin \frac{1}{2} A}.$$

Nodal points.—Two points on the axis of a lens such that a ray entering the lens in the direction of one, leaves as if from the other and parallel to the original direction.

Numerical aperture is the sine of half the angular aperture, used as a measure of the optical power of the objective.

Photographic density.—The density D of silver deposit on a photographic plate or film is defined by the relation

$$D = \log O$$

where O is the opacity. If I_0 and I are the incident and transmitted intensities respectively, the opacity is given by I_0/I. The transparency is the reciprocal of the opacity or I/I_0.

Polarized light.—Light which exhibits different properties in different directions at right angles to the line of propagation is said to be polarized. Specific rotation is the power of liquids to rotate the plane of polarization. It is stated in terms of specific rotation or the rotation in degrees per decimeter per unit density.

Principal focus of a lens or spherical mirror is the point of convergence of light coming from a source at an infinite distance.

Radius of curvature from spherometer readings.—If l is the mean length of the sides of the triangle formed by the points of the three legs, d the spherometer readings, the radius of curvature of the surface is

$$F = \frac{l^2}{6d} + \frac{d}{2}.$$

Reflection coefficient or reflectivity is the ratio of the light reflected from a surface to the total incident light. The coefficient may refer to diffuse or to specular reflection. In

general it varies with the angle of incidence and with the wave length of the light.

Reflection of light by a transparent medium in air. (Fresnel's formulae).—If i is the angle of incidence, r the angle of refraction, n_1 the index of refraction for air (nearly equal to unity), n_2 index of refraction for a medium, then the ratio of the reflected light to the incident light is,

$$R=\frac{1}{2}\left(\frac{\sin^2 (i-r)}{\sin^2 (i+r)}+\frac{\tan^2 (i-r)}{\tan^2 (i+r)}\right).$$

If $i = 0$ (normal incidence), and $n_1 = 1$ (approximate for air),

$$R=\left(\frac{n_2-1}{n_2+1}\right)^2$$

Refraction at a spherical surface.—If u be the distance of a point source, v the distance of the point image or the intersection of the refracted ray with the axis, n_1 and n_2 the indices of refraction of the first and second medium, and r the radius of curvature of the separating surface,

$$\frac{n_2}{v}+\frac{n_1}{u}=\frac{n_2 - n_1}{r}.$$

If the first medium is air the equation becomes,

$$\frac{n}{v}+\frac{1}{u}=\frac{n - 1}{r}$$

Refraction.—*See* Index of refraction; Snell's law.

Refractivity is given by $(n-1)$ when n is the index of refraction; the **specific refractivity** is given by $\frac{n-1}{d}$ where d is the density. **Molecular refractivity** is the product of specific refractivity by the molecular weight.

Resolving power of a telescope or microscope is indicated by the minimum separation of two objects for which they appear distinct and separate when viewed through the instrument.

Rotatory power is the power of rotating the plane of polarized light, given in general by θ/l where θ is the total rotation which occurs in a distance l.

The **molecular** or **atomic rotatory power** is the product of the specific rotatory power by the molecular or atomic weight. Magnetic rotatory power is given by

$$\theta/eH \quad \cos \alpha$$

where H the intensity of the magnetic field, and α the angle between the field and the direction of the light.

Snell's law of refraction.—If i is the angle of incidence, r the angle of refraction, v the velocity of light in the first medium, v' the velocity in the second medium, the index of refraction n,

$$n=\frac{\sin i}{\sin r}=\frac{v}{v'}.$$

Specific rotation.—If there are n grams of active substance in v cubic centimeters of solution and the light passes through l centimeters, r being the observed rotation in degrees, the specific rotation (for 1 centimeter),

$$[\alpha] = \frac{rv}{nl}.$$

Spectral series are spectral lines or groups of lines which occur in an orderly sequence. Many sequences may be represented by the equation

$$\frac{1}{\lambda} = A - \frac{BN}{(m+\alpha+\beta/m^2)^2}.$$

where λ is the wave length, m an integer varying from one line to another of the series. A, B, N, α and β are constants. B is an integer, N is Rydberg's constant.

Spherical aberration.—When large surfaces of spherical mirrors or lenses are used the light divergent from a point source is not exactly focused at a point. The phenomenon is known as spherical aberration. For axial pencils the error is known as axial spherical aberration; for oblique pencils, coma.

Spherical mirrors.—If R is the radius of curvature, F principal focus, and f_1 and f_2 any two conjugate focal distances,

$$\frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{F} = \frac{2}{R}.$$

If the linear dimensions of the object and image be O and I respectively and u and v their distances from the mirror,

$$\frac{O}{I} = \frac{u}{v}.$$

Total reflection.—When light passes from any medium to one in which the velocity is greater, refraction ceases and total reflection begins at a certain critical angle of incidence θ such that

$$\sin\theta = \frac{1}{n}.$$

where n is the index of the first medium with respect to the second. If the second medium is air n has the ordinary value for the first medium. For any other second medium,

$$n = \frac{n_1}{n_2}.$$

where n_1 and n_2 are the ordinary indices of refraction for the first and second medium respectively.

Visibility is measured by the ratio of the luminous flux in lumens to the total radiant energy in ergs per second or in watts.

MEASURES AND UNITS

FUNDAMENTAL STANDARDS

The primary standard of *length* is defined as the distance between two lines at 0° C on a platinum-iridium bar known as the International Prototype Meter deposited at the International Bureau of Weights and Measures. The International Prototype Meter is 1553164.13 times the wave length of the red cadmium line in air, 760 mm. pressure, 15° C.

The primary standard of *mass* is defined as the mass of the International Prototype Kilogram of platinum-iridium kept at the International Bureau of Weights and Measures at Sèvres. It is equal to the mass of 0.001000027 cubic meter of pure water at 4° C and 760 mm. pressure.

The primary standard of *time* is the mean solar second, one eighty six thousand four hundredth (1/86400) part of a mean solar day.

The standard scale of *temperature* adopted by the International Committee of Weights and Measures 1887 is based on the variations in pressure of hydrogen at constant volume. The hydrogen is taken at an initial pressure, at the temperature of melting ice, of one meter of mercury (0° C., sea level, latitude 45°). The scale is defined by taking the temperature of melting ice as 0° and that of condensing steam under 760 mm. pressure as 100°. This is known as the Centigrade (C) scale.

The *absolute* or *thermodynamic temperature scale* proposed by Lord Kelvin is based on the average kinetic energy per molecule of a perfect gas. The temperature of melting ice is 273.13° and that of the boiling point of water 373.13°. This is frequently referred to as the Kelvin (K) scale.

1 radian = 57° 17′ 44.8″ = 57.2958° = 3437.75′ = 206265″ = $\frac{1}{2\pi}$ of a circumference

1 grade = $\frac{1}{400}$ circumference = 100 centesimal minutes = 0.0157079 radian

1 centesimal minute = 100″ centesimal seconds

Solid Angle

1 steradian = $\frac{1}{4\pi}$ of the solid angle around a point.

UNITS AND CONVERSION FACTORS

Each unit named is followed by its equivalent in one or more other units of the same quantity. While the list of equivalents is incomplete it is intended to include all those which will be in common use.

Symbols in the dimensional formulae given after the headings have the following significance: m, mass; l, length; t, time; θ, temperature; ϵ, dielectric constant of a vacuum; μ, permeability of a vacuum.

Mass, Length, Time, Angle, Area and Volume

Acre (A.) (U. S.).—0.0015625 square mile; 10 square chains (Gunter's); 160 square rods or square perches; 4840 square yards; 4.3560×10^4 square feet; 1×10^5 square links (Gunter's); 0.4046873 hectare or square hectometer; 40.46873 ares or square dekameters; 4046.873 square meters.

Acre (A.) (British).—4 roods (British); 4840 square yards (British); 0.4046849 hectare or square hectometer; 4046.849 square meters.

Ångström Unit (Å. or Å. U.).—3.937×10^{-9} inch; 0.003937 millionths of an inch; 1×10^{-10} meter; 1×10^{-8} centimeter; 1×10^{-4} micron (μ); 0.1 milli-micron or micro-millimeter; 100 millionth microns or micro-microns ($\mu\mu$).

Are (a).—3.8610×10^{-5} square mile; 0.02471044 acre (U. S.); 119.60 square yards; 1076.4 square feet; 0.01 hectare; 1 square dekameter; 100 square meters.

Astronomical unit.—1.495×10^8 kilometers.

Bag (British).—3 bushels (dry); 0.109107 cubic meter.

Barleycorn (British).—1/3 inch; 0.84667 centimeter.

Barrel (bbl.) (U. S., dry).—3.281 bushels; 105.0 quarts (dry); 7056 cubic inches for dry commodities except cranberry barrel which = 5826 cubic inches; 0.11562 cubic meter.

Barrel (bbl.) (U. S., liquid).—31.5 gallons; 0.11924 cubic meter.

Barrel (bbl.) (British, dry).—36 gallons (British); 0.16366 cubic meter.

Board Foot (bd. ft.).—1/12 cubic foot; 144 cubic inches (1 foot × 1 foot × 1 inch); 2359.8 cubic centimeters.

Bolt (U. S., cloth.).—120 linear feet; 36.576 meters.

Bucket (British, dry).—4 gallons (British); 1.8184×10^4 cubic centimeters.

Bushel (bu.) (U. S., dry).—0.304785 barrel; 0.96945 bushel (British); 1.2444 cubic feet, 4 pecks, 32 quarts (dry); 64 pints (dry); 2150.42 cubic inches; 0.035239 cubic meter; 0.35238 hectoliter; 3.5238 dekaliters; 35.238 liters; 3.5239×10^4 cubic centimeters.

Bushel (bu.) (British, dry).—⅛ or 0.125 quarter (British, capacity); 1/3 or 0.33333 bag (British); 1.03151 bushels (U. S.); 1.2843 cubic feet; 8 gallons (British); 2219.3 cubic inches; 0.363677 hectoliter; 3.63677 dekaliters; 36.3677 liters; 3.6369×10^4 cubic centimeters.

Butt (British, dry).—126 gallons; 0.57281 cubic meter.

Cable Length (British & U. S.).—720 feet; 219.46 meters.

Carat (c) (metric).—3.08647 grains; 0.2 gram; 200 milligrams.

Carat (c) (1877).—3.168 grains, 205.6 milligrams.

Cental.—100 pounds; 45.359 kilograms.

Centare (ca).—1.196 square yards; 10.764 square feet; 1550 square inches; 0.01 are; 1 square meter.

Centigram (cg).—0.1543236 grain; 0.01 gram.

Centiliter (cl).—0.33815 ounce (fluid, U. S.); 0.61025 cubic inch; 2.705179 drams (fluid, U. S.); 0.01 liter; 10.00027 cubic centimeters.

Centimeter (cm).—0.01093611 yard (U. S.); 0.01093614 yard (British); 0.032808 foot (U. S. or British); 0.39370 inch (U. S. or British); 4.4330 lignes (Paris lines); 393.70 mils; 0.01 meter; 10 millimeters; 1×10^4 microns; 1×10^7 milli-microns or micro-millimeters; 1×10^8 Ångström units.

Chain (ch.) (Engineer's or Ramden's).—100 feet; 100 links of 1 foot each; 30.4801 meters.

Chain (ch.) (Surveyor's or Gunter's).—0.1 furlong; 0.0125 mile; 4 rods; 22 yards; 66 feet; 100 links; 792 inches; 20.117 meters; 2011.7 centimeters.

Chaldron (U. S., dry).—*36 bushels (U. S.); 1.2686 cubic meters.

Chaldron (British, dry).—*32 bushels (British); 1.1638 cubic meters.

Circle (cir.).—2π or 6.2832 radians; 12 signs; 360 degrees.

Circular Inch.—Area of circle, diameter of which is one inch; 0.78540 square inch; 5.0671 square centimeters.

Circular Mil.—Area of circle, diameter of which is one mil

*Variable.

or 1/1000 inch; 7.854×10^{-7} square inch; 0.78540 square mil; 5.0671×10^{-6} square centimeter; 5.0671×10^{-4} square millimeter.

Circular Millimeter.—0.0078540 square centimeter; 0.78540 square millimeter.

Circumference.—2π or 6.28319 radians; 360 degrees; 400 grades; 1.2600×10^{4} minutes; 1.296000×10^{6} seconds.

Clove or Customary Stone (British).—8 pounds; 3.6287 kilograms.

Coomb (British, dry).—4 bushels; 0.14548 cubic meter.

Cord (cd.).—8 cord feet; 128 cubic feet (8 feet×4 feet×4 feet); 3.625 cubic meters.

Cord-Foot (cd. ft.)—⅛ or 0.125 cord; 16 cubic feet (4 feet×4 feet×1 foot).

Cubic Centimeter (cm³).—1.3079×10^{-6} cubic yard; 2.7496×10^{-5} bushel (British); 2.83776×10^{-5} bushel (U. S.); 3.531445×10^{-5} cubic foot (U. S.); 3.531477×10^{-5} cubic foot (British); 2.1997×10^{-4} gallon (British); 2.6417×10^{-4} gallon (U. S.); 4.2376×10^{-4} board foot; 8.7988×10^{-4} quart (liquid, British), 9.0808×10^{-4} quart (dry, U. S.); 0.0010567 quart (liquid, U. S.); 0.0018162 pint (dry, U. S.); 0.0021134 pint (liquid, U. S.); 0.033814 ounce (fluid, U. S.); 0.035195 ounce (fluid, British); 0.061023 cubic inch; 0.27051 dram (fluid, U. S.); 0.28157 drachm (fluid, British); 16.231 minims (U. S.); 16.894 minims (British); 1×10^{-6} cubic meter; 9.9997×10^{-4} liter; 0.001 cubic decimeter; 0.99997 milliliter; 1000 cubic millimeters.

Cubic Decimeter (dm³).—0.0013079 cubic yard; 0.035314 cubic foot; 61.023 cubic inches; 0.001 cubic meter; 0.99997 liter; 1000 cubic centimeters.

Cubic Dekameter (dkm³).—1000 cubic meters.

Cubic Foot (ft.³ or cu. ft.) (U. S.).—1/128 or 0.0078125 cord. 0.01 register ton (British); 1/27 or 0.037037 cubic yard; 1/16 or 0.0625 cord-foot; 0.77861 bushel (British); 0.80357 bushel (U. S.); 6.229 gallons (British); 7.481 gallons (U. S.); 12 board feet; 25.714 quarts (dry, U. S.); 29.922 quarts (liquid, U. S.); 59.844 pints (liquid, U. S.); 1728 cubic inches; 0.02831701 cubic meter; 28.316 liters; 2.8317×10^{4} cubic centimeters.

Cubic Foot (ft.³ or cu. ft.) (British).—0.02831677 cubic meter; 2.831677×10^{4} cubic centimeters.

Cubic Inch (in.³ or cu. in.) (U. S.).—2.143347×10^{-5} cubic yard; 4.65025×10^{-4} bushel (U. S.); 5.78704×10^{-4} cubic foot; 0.00186010 peck; 0.0043290 gallon (U. S.); 1/144 or 0.006944 board foot; 0.014881 quart (dry, U. S.); 0.017316 quart (liquid, U. S.); 0.0297616 pint (dry); 0.5541 ounce (fluid); 4.4329 drams

(fluid); 1.6387162×10^{-5} cubic meter; 0.0163868 liter; 1.63868 centiliters; 16.3868 milliliters; 16.387162 cubic centimeters; 1.6387162×10^{4} cubic millimeters.

Cubic Inch (in.³ or cu. in) (British).—4.5081×10^{-4} bushel (British); 5.7870×10^{-4} cubic foot (British); 0.0018031 peck (British); 0.003606 gallon (British); 16.3870253 cubic centimeters.

Cubic Hectometer (hm³).—1×10^{6} cubic meters.

Cubic Kilometer (km³).—1×10^{9} cubic meters.

Cubic Meter (m³).—0.2759 cord; 1.3079428 cubic yards (U. S.); 1.307954 cubic yards (British); 28.3776 bushels (U. S.); 35.314445 cubic feet (U. S.); 35.31477 cubic feet (British); 264.173 gallons (U. S.); 1056.7 quarts (liquid); 2113.4 pints (liquid, U. S.); 6.1023×10^{4} cubic inches; 1 stere; 999.973 liters; 1000 cubic decimeters; 1×10^{6} cubic centimeters; 1×10^{9} cubic millimeters.

Cubic Millimeter (mm³).—6.1023×10^{-5} cubic inch; 0.01623 minim (U. S.); 0.01689 minim (British); 1×10^{-9} cubic meter; 0.001 cubic centimeter.

Cubic Yard (yd.³ or cu. yd.) (U. S.).—27 cubic feet; 168.17 gallons (British); 202.0 gallons (U. S.); 807.9 quarts (liquid, U. S.); 1616 pints (liquid, U. S.); 4.6656×10^{4} cubic inches; 0.76455945 cubic meter; 764.54 liters; 7.6455945×10^{5} cubic centimeters.

Cubic Yard (yd.³ or cu. yd.) (British).—27 cubic feet; 0.76455285 cubic meter.

Cubit.—18 inches; 45.72 centimeters.

Dalton.—1/16 the mass of an atom of oxygen; 1.650×10^{-24} gram.

Day (da) **(tropical, mean solar).**—24 hours (mean solar); 1440 minutes (mean solar); 8.6400×10^{4} seconds (mean solar).

Day (da) **(sidereal).**—8.6164×10^{4} seconds (mean solar).

Decigram (dg.).—1.543236 grains; 0.1 gram.

Deciliter (dl).—0.176 pint (British); 3.38147 ounces (fluid, U. S.); 0.1 liter; 100.0027 cubic centimeters.

Decimeter (dm).—0.3280833 foot (U. S.); 0.3280843 foot (British); 3.93700 inches (U. S.); 3.937011 inches (British); 0.1 meter.

Decistere (ds).—0.1 stere or cubic meter.

Degree (°).—1/360 or 0.0027778 circumference or revolution; 1/90 or 0.01111 quadrant; 0.017453 radian; 60 minutes; 3600 seconds.

Dekagram (dkg).—0.35273957 ounce (avoirdupois); 5.64383 drams (avoirdupois); 0.01 kilogram; 10 grams.

Dekaliter (dkl).—0.27497 bushel (British); 0.28378 bushel (U. S.); 1.13513 pecks (U. S.); 9.08102 quarts (U. S., dry); 18.162 pints (dry, U. S.); 10 liters; 10.00027 cubic decimeters.

Dekameter (dkm).—1.98838 rods (U. S.); 10.93611 yards (U. S.); 10.93614 yards (British); 393.70 inches; 10 meters.

Dekastere (dks).—10 steres or cubic meters.

Drachm (fluid) (dr. fl. or ʒ fl.) (British).—⅛ or 0.125 ounce (fluid, British); 60 minims; 3.5515 cubic centimeters.

Dram (apothecaries' or troy) (dr. ap. or t. or ʒ ap. or t.)—(Same as British Drachm)—0.008571429 pound (avoidrupois); 1/96 or 0.010416667 pound (apothecary or troy); ⅛ or 0.12500 ounce (apothecary or troy); 0.1371429 ounce (avoirdupois); 2.194286 drams (avoirdupois); 2.5 pennyweights; 3 scruples; 60 grains; 3.8879351 grams.

Dram (avoirdupois) (dr. av. or ʒ av.).—1/256 or 0.00390625 pound (avoirdupois); 0.0047471788 pound (apothecary or troy); 0.056966146 ounce (apothecary or troy); 0.0625 ounce (avoirdupois); 0.4557292 dram (apothecary or troy); 1.139323 pennyweights; 1.3671875 scruples; 27.34375 grains; 1.771845 grams; 1771.845 milligram.

Dram (fluid) (dr. fl. or ʒ fl.) (U.S.).—0.00390625 quart (liquid, U. S.); 0.0078125 pint (liquid, U. S.); 0.03125 gill (U. S.); ⅛ or 0.125 ounce (fluid); 0.225586 cubic inch; 60 minims; 3.6966 milliliters; 3.6967 cubic centimeters.

Ell.—45 inches; 114.30 centimeters.

Em, Pica (printing industry).—1/6 or 0.16667 inch; 0.42333 centimeter.

Fathom (fath.) (nautical).—6 feet, 1.828804 meter.

Firkin (fir.) (U. S.).—9 gallons (U. S.); 34.068 liters.

Firkin (fir.) (British).—9 gallons (British); 40.914 liters.

Fluid Ounce (fl. oz.)—See **Ounce (Fluid)**.

Foot (ft.) (U. S.)—1.6447 $\times$ 10^{-4} mile (nautical); 1.893939 $\times$ 10^{-4} mile (statute); 0.00151515 furlong; 0.0151515 chain (Gunter's); 0.0606061 rod; 1/6 or 0.16667 fathom; 1/3 or 0.33333 yard; 12 inches; 0.3048006 meter, 30.48006 centimeter; 473404 wave-lengths of red line of cadmium.

Foot (ft.) (British).—0.4 pace (British); 30.47997 centimeters.

Foot (Paris).—(See **Pied**).

Furlong (fur.) (U. S. or British).—⅛ or 0.125 mile (U. S.); 10 chains(Gunter's); 40 rods, 220 yards; 660 feet; 201.168 meters.

Gallon (gal.) (U. S.).—1 U. S. gallon of water at 15°C (62°F) weighs 3.7820 kilograms or 8.337 pounds (avoirdupois); 0.004951 cubic yard; 0.031746 barrel (liquid, U. S.); 0.13368 cubic foot; 0.83268 gallons (British); 4 quarts (liquid); 8 pints (liquid); 32 gills; 128 ounces (fluid); 231.00 cubic inches; 6.1440×10^4 minims; 0.0037854 cubic meter; 3.7853 liters; 3785.4 cubic centimeters.

Gallon (gal.) (British Imperial) (Canadian).—1 British gallon of water at 15°C (62°F) has a mass of 10 pounds (avoirdupois); 0.02778 barrel (dry, British); ⅛ or 0.125 bushel (dry, British); 0.16054 cubic foot; 0.5 peck (British); 1.20094 gallons (U. S.); 4 quarts (liquid, British); 8 pints (liquid, British); 32 gills (liquid, British); 160 ounces (fluid, British); 277.3 cubic inches; 4.54596 liters; 4546.1 cubic centimeters.

Geepound—See **Slug.**

Gill (gi.) (U. S.).—1/32 or 0.03125 gallon (U. S.); ⅛ or 0.125 quart (liquid, U. S.); ¼ or 0.25 pint (liquid, U. S.); 4 ounces (fluid); 7.21875 cubic inches; 32 drams (fluid); 1920 minims; 0.118292 liters; 118.295 cubic centimeters.

Gill (gi.) (British).—1/32 or 0.03125 gallon (British); ¼ or 0.25 pint (liquid, British); 4 ounces (fluid, British); 0.14206 liter; 142.07 cubic centimeters.

Grade—1/400 or 0.0025, circumference; 0.0157079 radian; 0.9 degree; 100 centesimal minutes.

Grain (gr.).—1/7000 or 1.42857×10^{-4} pound (avoirdupois); 1/5760 or 1.736111×10^{-4} pound (apothecary or troy); 0.0020833 ounce (apothecary or troy); 0.0022857 ounce (avoirdupois); 0.016667 dram (apothecary or troy); 0.03657143 dram (avoirdupois); 0.0416667 pennyweight (troy); 0.05000 scruple (apothecary); 0.064798918 gram; 0.3240 carat (metric); 64.798918 milligram.

Gram (g).—0.00220462 pound (avoirdupois); 0.00267923 pound (apothecary or troy); 0.0321507 ounce (apothecary or troy); 0.0352739 ounce (avoirdupois); 0.257206 dram (apothecary or troy); 0.564383 dram (avoirdupois); 0.6430149 pennyweight; 0.771618 scruple; 15.4324 grains; 1×10^{-6} ton (metric); 1×10^{-4} myriagram; 0.001 kilogram; 5 carats (metric); 1000 milligrams; 1×10^6 microgram.

Hand.—4 inches; 10.160 centimeters.

Hectare (ha)—2.471044 acres (U. S.); 2.471058 acres (British); 395.367 square rods (U. S.); 1.195985×10^4 square yards (U. S.); 1.0764×10^5 square feet; 100 ares; 1×10^4 square meters.

Hectogram (hg).—3.52739 ounces (avoirdupois); 100 grams.

Hectoliter (hl).—2.7497 bushels (British); 2.8378 bushels (U. S.); 11.3513 pecks (U. S.); 100 liters.

Hectometer (hm).—19.8838 rods; 109.3611 yards (U. S.); 109.3614 yards (British); 328.08 feet (U. S.); 100 meters.

Hemisphere.—0.5 sphere; 4 spherical right angles; 6.2832 steradians.

Hogshead (hhd.) **(British).**—63 gallons (British); 10.114 cubic feet; 0.28640 cubic meters.

Hogshead (hhd.) **(U. S.).**—63 gallons (U. S.); 8.4218 cubic feet; 0.23848 cubic meter.

Hour (hr.) **(tropical, mean solar).**—0.0059524 week; 0.041667 day (mean solar); 60 minutes (mean solar); 3600 seconds (mean solar).

Hundredweight (cwt.) **(short).**—100 pounds; 0.044643 ton (long); 0.05 ton (short); 4 quarters (British); 1600 ounces (avoirdupois); 0.0453592 ton (metric); 45.3592 kilograms.

Hundredweight (cwt.) **(long).**—112 pounds; 0.05 ton (long); 4 quarters (British); 50.8023 kilograms.

Inch (in.) **(U. S.).**—1.57828×10^{-5} mile; 0.00126263 chain (Gunter's); 0.00505051 rod; 1/36 or 0.027778 yard; 1/12 or 0.08333 foot; 0.126263 link (Gunter's); 72 points (printer's type); 1000 mils; 2.540005 centimeter; 25.40005 millimeters; 2.5400×10^{8} Ångström unit; 39450.33 wave lengths of red line of cadmium.

Inch (in.) **(British).**—1/36 or 0.027778 yard (British); 1/9 or 0.1111 quarter (British, linear); 2.539998 centimeters; 25.39998 millimeter.

Inch (Paris).—See **Pouce.**

Kilderkin (British).—18 gallons (British); 0.081830 cubic meter.

Kilogram (kg).—9.842064×10^{-4} ton (long); 0.0011023112 ton (short); 0.019684 hundredweight (long); 0.022046223 hundredweight (short); 0.07874 quarter (British); 2.2046223 pounds (avoirdupois); 2.6792285 pounds (apothecary or troy); 32.150742 ounces (apothecary or troy); 35.273957 ounces (avoirdupois); 257.21 dram (apothecary or troy); 564.38 dram (avoirdupois); 643.01 pennyweight; 771.62 scruples; 1.54324×10^{4} grains; 0.001 ton (metric); 1000 grams.

Kiloliter (kl).—1.3080 cubic yards; 35.316 cubic feet; 264.18 gallons (liquid, U. S.); 1.000027 cubic meters; 1000 liters.

Kilometer (km).—1.0567×10^{-13} light year; 0.53961 mile (nautical); 0.62137 mile (statute); 1093.6 yards; 3280.8 feet; 0.1 myriameter; 1000 meters; 1×10^{5} centimeters.

Knot as a unit of length.—1 nautical mile, which see. The knot is properly a unit of speed or velocity. See under that heading.

Last (British).—*80 bushels; 2.9095 cubic meters.

League (statute).—3 statute miles; 4.8280 kilometers.

League (nautical).—3 nautical miles; 5.5597 kilometers.

Light Year (yr.).—5.9×10^{12} miles; 9.4637×10^{12} kilometers.

Ligne (Paris line).—1/12 or 0.083333 pouce or Paris inch; 0.225583 centimeter.

Line (British) (obsolete)—1/12 or 0.08333 inch; 0.21167 centimeters.

Link (li.) (Engineer's or Ramden's).—0.01 chain (Engineer's); 1 foot; 12 inches; 30.480 centimeter.

Link (li.) (Surveyor's or Gunter's).—1.2500×10^{-4} mile 0.01 chain (Gunter's); 0.04 rod; 0.22 yards; 0.66 foot; 7.92 inches; 0.2011684 meter; 20.11684 centimeters.

Liter (l).—0.0013080 cubic yard; 0.027497 bushel (British); 0.028378 bushel (U. S.); 0.21998 gallon (British); 0.26417762 gallon (U. S.); 0.035316 cubic foot; 0.10999 peck (British); 0.11351 peck (U. S.); 0.87990 quart (British); 0.90811 quart (dry, U. S.); 1.056710 quarts (liquid, U. S.); 1.7598 pints (British); 1.8162 pints (dry, U. S.); 2.1134 pints (liquid, U. S.); 7.0392 gills (British); 8.4538 gills (U. S.); 33.8147 ounces (fluid, U. S.); 35.196 ounces (fluid, British); 61.025 cubic inches; 270.5179 drams (fluid, U. S.); 0.001000027 cubic meter; 1.000027 cubic decimeter; 1000.027 cubic centimeter.

Megameter.—1×10^{6} meter.

Meter (m).—5.3961×10^{-4} mile (nautical); 6.2137×10^{-4} mile (statute); 0.00497096 furlong; 0.0497096 chain (Gunter's); 0.198838 rod (U. S.); 0.54681 fathom; 1.093611 yards (U. S.); 1.093614 yards (British); 3.0784 pied (French foot); 3.280833 feet (U. S.); 3.280843 feet (British); 4.970960 links (Gunter's); 39.3700 inches (U. S.); 39.3701 inches (British); 1×10^{-6} megameter; 0.001 kilometer; 100 centimeters; 1×10^{9} milli-microns or micro-millimeters; 1×10^{10} Angstrom unit; 1×10^{12} millionth microns ($\mu\mu$) 1.55316413×10^{6} wave-lengths of red line of cadmium.

Metric carat (c) See **Carat** (**metric**).

Metric Ton (t) See **Tonne.**

Microgram (μg or γ).—1×10^{-6} gram; 0.001 milligram.

---

*Variable.

Microliter (μ**l or** λ).—1×10^{-6} liter.

Micromicron ($\mu\mu$).)—1×10^{-12} meter.

Micron (μ).—3.937×10^{-5} inch; 0.039370 mil; 39.37 millionths of an inch; 1×10^{-6} meter; 1×10^{-4} centimeter; 0.001 millimeter; 1000 milli-microns or micro-millimeters; 1×10^{4} Ångström units.

Mil.—0.001 inch; 0.00254001 centimeter; 0.0254001 millimeter; 25.4001 microns.

Mile (mi.) (**U. S., statute**).—1.69×10^{-13} light year; 0.86836 mile (nautical); 8 furlongs; 80 chains (Gunter's); 320 rods; 1760 yards; 5280 feet; 8000 links (Gunter's); 6.3360×10^{4} inches; 0.160935 myriameters; 1.60935 kilometers; 1609.35 meters.

Mile (mi.) (**British**).—1.60934 kilometers.

Mile (mi.) (**nautical**).—The length of 1 minute of arc on the earth's surface at the equator; 1/3 or 0.33333 league; 1.1516 miles (statute); 2026.8 yards; 6080.2 feet; 1.85325 kilometers.

Millier (t) See **Tonne.**

Milligram (**mg**). — 2.2046×10^{-6} pound (avoirdupois); 2.67923×10^{-6} pound (apothecary or troy); 3.215074×10^{-5} ounce (apothecary or troy); 3.52739×10^{-5} ounce (avoirdupois); 2.57206×10^{-4} dram (apothecary or troy); 5.64383×10^{-4} dram (avoirdupois); 6.43015×10^{-4} pennyweight; 7.71618×10^{-4} scruple; 0.01543236 grain; 1×10^{-6} kilogram; 0.001 gram; 0.005 carat (metric).

Milliliter (**ml**).—0.0084538 gill (U. S.); 0.0338147 ounce (fluid, U. S.); 0.035196 ounce (fluid, British); 0.061025 cubic inch; 0.2705179 dram (fluid, U. S.); 16.2311 minims (U. S.); 0.001 liter; 1.000027 cubic centimeter.

Millimeter (**mm**).—0.0393700 inch (U. S.); 0.0393701 inch (British); 39.37 mils; 0.001 meter; 0.1 centimeter; 100 microns.

Milli-Micron or Micro-Millimeter (mμ).—1×10^{-9} meter; 1×10^{-7} centimeter; 0.001 micron; 10 Ångström units.

Millionth Micron or Micro-Micron ($\mu\mu$).—1×10^{-12} meter; 1×10^{-10} centimeter; 0.01 Ångström units.

Minim (**min. or** ♍) (**British**).—0.059194 cubic centimeter.

Minim (**min. or** ♍) (**fluid, U. S.**).—1/61440 or 1.6276×10^{-5} gallon (U. S.); 1.3021×10^{-4} pint (liquid, U. S.); 5.2083×10^{-4} gill (U. S.); 1/480 or 0.0020833 ounce (fluid, U. S.); 1/60 or 0.016667 dram (fluid, U. S.); 0.061610 milliliter; 0.061612 cubic centimeter; 61.612 cubic millimeter.

Minute (′) (**angle**).—1.8519×10^{-4} quadrant; 2.90888×10^{-4} radian; 1/60 or 0.016667 degree; 60 seconds.

Minute (**min.**) (**time**).—9.9206×10^{-5} week; 4.90196×10^{-4} day; 0.016667 hour; 60 seconds.

Month (**mo.**) (**mean calendar**).—30.42 days; 730 hours; 4.3800×10^{4} minutes; 2.628×10^{6} seconds.

Month (**mo.**) (**lunar**).—29 days 12 hours 44 minutes.

Myriagram (**Mg**).—22.04622 pounds (avoirdupois); 10 kilograms; 1×10^{4} grams.

Myriameter (**Mm**).—6.21372 miles; 10 kilometers; 1×10^{4} meters.

Nail (**British**).—2.25 inch; 5.715 centimeters.

Noggin (**British**).—1/32 or 0.03125 gallon (liquid); 142.06 cubic centimeters.

Ounce (**Fluid**) (**oz. fl. or ℥ fl.**) (**U. S.**).—1/128 or 0.0078125 gallon (U. S.); 0.03125 quart (liquid, U. S.); 1/16 or 0.0625 pint (liquid); ¼ or 0.25 gill (U. S.); 1.80469 cubic inches; 8 drams (fluid); 480 minims; 0.0295729 liter; 0.295729 deciliter; 29.5729 milliliters; 29.5737 cubic centimeters.

Ounce (**fluid**) (**oz. fl. or ℥ fl.**) (**British**).—0.006250 gallon (British); 8 drachms (fluid, British); 480 minims; 28.4130 cubic centimeters.

Ounce (**avoirdupois**) (**oz. av. or ℥ av.**).—2.790179×10^{-5} ton (long); 3.125×10^{-5} ton (short); 6.25×10^{-4} hundredweight (short); 1/16 or 0.062500 pound (avoirdupois); 0.075954861 pound (apothecary or troy); 0.9114583 ounce (apothecary or troy); 7.29166 drams (apothecary or troy); 16 drams (avoirdupois); 18.22917 pennyweights; 21.875 scruples (apothecary); 437.5 grains; 2.83495×10^{-5} ton (metric); 28.349527 grams.

Ounce (**apothecary or troy**) (**oz. ap. or t. or ℥ ap. or t.**).—3.4285×10^{-5} ton (short); 0.06857143 pound (avoirdupois); 0.08333 pound (apothecary or troy); 1.09714 ounces (avoirdupois); 8 drams (apothecary or troy); 17.55428 drams (avoirdudupois); 20 pennyweights (troy); 24 scruples; 480 grains; 31.103481 grams; 3.1103481×10^{4} milligrams.

Pace.—2½ feet; 30 inches (British); 76.2 centimeters.

Palm (**British**).—3 inches; 7.62 centimeters.

Parsec.—19×10^{12} miles; 3.084×10^{13} kilometers.

Peck (**pk.**) (**U. S.**).—¼ or 0.25 bushel; 8 quarts; 16 pints; 537.605 cubic inches; 0.880958 dekaliter; 8.80958 liters.

Peck (**pk.**) (**British**).—2 gallons (British); 554.6 cubic inches; 9.0923 liters.

Pennyweight (**dwt.**) (**troy**).—0.003428571 pound (avoirdupois); 0.0041667 pound (apothecary or troy); 1/20 or 0.05

ounce (apothecary or troy); 0.0548571 ounce (avoirdupois); 0.8777143 dram (avoirdupois); 24 grains; 1.55517 grams; 1555.17 milligrams.

Perch (British & U. S.).—1 rod; 16.5 feet; 5.0292 meters.

Perch (masonry).—24.75 cubic feet.

Pied (French foot).—1/6 or 0.16667 toise (French); 12 Paris inches; 0.3248 meter.

Pint (pt.) (dry, U. S.).—1/64 or 0.015625 bushel; 0.0625 peck; 0.5 quart; 33.600 cubic inches; 0.550599 liter; 550.61 cubic centimeters.

Pint (pt.) (liquid, U. S.).—6.1881×10^{-4} cubic yard; 0.016711 cubic foot; 1/8 or 0.125 gallon (U. S.); 0.5 quart (U. S.); 0.83268 British pint; 4 gills (U. S.); 16 fluid ounces (U. S.); 28.875 cubic inches; 128 fluid drams; 7680 minims; 0.473167 liter; 473.167 milliliters; 473.179 cubic centimeters.

Pint (pt.) (liquid, British).—1/8 or 0.125 gallon (British); 0.5 quart (British); 1.20094 U. S. pints; 4 gills (British); 20 fluid ounces (British); 0.56825 liter; 568.25 milliliters; 568.26 cubic centimeters.

Point (printer's type).—1/72 or 0.01389 inch; 0.035278 centimeter.

Pole (British).—1 rod; 5.5 yards; 16.5 feet; 5.0292 meters.

Pottle (British).—1/2 gallon (liquid); 2.273 cubic decimeters.

Pouce (Paris inch).—1/12 or 0.083333 pied or Paris foot; 12 lignes or Paris lines; 2.70700 centimeters.

Pound (avoirdupois) (lb. av.) (U. S. or British).—Is the mass of 27.692 cubic inches of water weighed in air at 4° C, 760 mm pressure; 4.464286×10^{-4} ton (long); 5×10^{-4} ton (short); 0.0089286 hundredweight (long); 0.01 hundredweight (short); 1.2152778 pounds (apothecary or troy); 14.5833 ounces (apothecary or troy); 16 ounces (avoirdupois); 116.6667 drams (apothecary or troy); 256 drams (avoirdupois); 291.6667 pennyweights; 350.01 scruples; 7000 grains; 4.5359243×10^{-4} ton (metric); 0.4535924 kilogram; 453.5924 grams.

Pound (apothecary or troy) (lb. ap. or t.) (U. S. or British).—3.6735×10^{-4} ton (long); 4.1143×10^{-4} ton (short); 0.822857 pound (avoirdupois); 12 ounces (apothecary or troy); 13.165714 ounces (avoirdupois); 96 drams (apothecary or troy); 210.6514 drams (avoirdupois); 240 pennyweights; 288 scruples; 5760 grains; 3.7324×10^{-4} ton (metric); 0.3732418 kilogram; 373.2418 grams.

Puncheon (British).—70 gallons (British); 84 wine gallons; 0.31823 cubic meter.

Quadrant.—1.57080 radians; 90 degrees; 5400 minutes.

Quart (qt.) (U. S., dry).—1/32 or 0.03125 bushel; 0.038889 cubic foot; ⅛ or 0.125 peck; 2 pints (dry); 67.2006 cubic inches; 1.10120 liters; 1101.23 cubic centimeters.

Quart (qt.) (U. S., liquid).—0.033421 cubic foot; ¼ or 0.25 gallon; 2 pints (liquid); 8 gills; 32 ounces (fluid); 57.749 cubic inches; 256.00 drams (fluid); 0.946333 liter; 946.358 cubic centimeters.

Quart (qt.) (British, liquid).—¼ gallon (British); 2 pints (liquid, British); 1.13650 liters; 1136.52 cubic centimeters.

Quarter (U. S., mass).—¼ short ton or 500 pounds; 226.795 kilograms.

Quarter (U. S., mass).—¼ long ton or 560 pounds; 254.01 kilograms.

Quarter (British, capacity)—8 bushels; 2.909 hectoliters.

Quarter (British, linear).—1 span; ¼ yard; 9 inches; 22.860 centimeters.

Quarter (British, mass).—¼ short hundredweight or 25 pounds; 11.340 kilograms.

Quarter (British, mass).—¼ long hundredweight or 28 pounds; 12.70 kilograms.

Quartern (British, dry).—½ gallon; 2273.1 cubic centimeters.

Quartern (British, liquid).—1/32 gallon; 142.07 cubic centimeters.

Quintal (q) (metric).—1.96841 hundredweights (long); 220.46 pounds; 100 kilograms; 1×10^5 grams.

Quintal* (q) (U. S. or British).—100 or 112 pounds.

Quire.—25 sheets.

Radian.—$\frac{1}{2}\pi$ or 0.159155 circumference or revolution; 0.637 quadrant; 57.29578 degrees; 57° 17′ 44.8″; 3437.75 minutes; 2.06265×10^5 seconds.

Ream.—500 sheets.

Register Ton (British).—100 cubic feet; 2.8317 cubic meters.

Revolution.—4 quadrants; 2π or 6.2832 radians; 360 degrees.

Rod (rd.) (surveyor's measure).—0.003125 mile; 0.025 furlong; 0.25 chain (Gunter's); 1 perch; 5.5 yards; 16.5 feet; 25 links; 198 inches; 5.029210 meters.

Rod (rd.) (British, volume).—1000 cubic feet; 28.317 cubic meters.

---

*Variable.

Rood (British).—¼ or 0.25 acre; 40 square perches; 1210 square yards; 10.117 ares or square dekameters.

Rope (British).—20 feet; 6.0960 meters.

Sack (British).—3 bushels; 0.10911 cubic meter.

Scruples (apothecary) (s. ap. or ℈).—0.002857143 pound (avoirdupois); 0.003472222 pound (apothecary or troy); 0.041667 ounce (apothecary or troy); 0.0457143 ounce (avoirdupois); 1/3 or 0.33333 dram (apothecary or troy); 0.7314286 dram (avoirdupois); 0.833333 pennyweight; 20 grains; 1.2959784 grams; 1295.9784 milligrams.

Seam (British).—8 bushels; 0.29095 cubic meter.

Second (Angle) (″).—4.84814×10^{-6} radian; 2.7778×10^{-4} degree; 0.016667 minute.

Second (sec) (time, mean solar).—1.1574×10^{-5} day (mean solar); 1.1606×10^{-5} day (sidereal); 2.7778×10^{-4} hour (mean solar); 0.016667 minute (mean solar); 1.00273791 seconds (sidereal).

Second (sec) (time, sidereal).—0.997270 second (mean solar).

Sign (s).—30 degrees.

Skein.—360 feet; 109.73 meters.

Slug.—1 geepound; 32.174 pounds; 14.594 kilograms.

Space, Entire (solid angle).—4π or 12.5664 steradians.

Span.—⅛ fathom; 1 quarter (British, linear); 9 inches; 22.86005 centimeters.

Sphere (solid angle).—2 hemispheres; 4π or 12.5664 steradians.

Spherical Right Angle.—⅛ or 0.125 sphere; ¼ or 0.25 hemisphere; $\pi/2$ or 1.5708 steradians.

Square Centimeter (cm^2).—2.47104×10^{-7} square chain; 3.95367×10^{-6} square rod; 1.1960×10^{-4} square yard; 0.0010764 square foot; 0.00247104 square link; 0.15500 square inch; 1.5500×10^{5} square mils; 1.9735×10^{5} circular mils; 127.32 circular millimeters; 1×10^{-4} square meter; 0.01 square decimeter; 100 square millimeters.

Square Chain (sq. ch.) (Gunter's).—1.5625×10^{-4} square mile; 16 square rods; 484 square yards; 4356 square feet; 1×10^{4} square links; 6.27264×10^{5} square inches; 404.6873 square meters.

Square Decimeter (dm^2).—15.500 square inch; 0.01 square meter; 100 square centimeters.

Square Degree.—3.0462×10^{-4} steradian.

Square Dekameter (dkm^2).—0.02471044 acre (U. S.); 119.60 square yards; 1 are; 100 square meters.

Square Foot (**ft.^{2} or sq. ft.**) (**U. S.**).—3.58701×10^{-8} square mile; 2.29568×10^{-5} acre; 2.29568×10^{-4} square chain; 0.00367309 square rod; 1/9 or 0.111111 square yard; 2.29568 square links; 144 square inches; 9.290341×10^{-4} are; 0.09290341 square meter; 929.0341 square centimeters.

Square Foot (**ft.^{2} or sq. ft.**) (**British**).—0.09290289 square meter.

Square Hectometer (hm^2).—2.471044 acres (U. S.); 2.471058 acres (British); 1×10^4 square meters.

Square Inch (**in.^{2} or sq. in.**) (**U. S.**).—1.59423×10^{-6} square chain; 1/144 or 0.0069444 square foot; 1/1296 or 0.000771605 square yard; 0.0159423 square link; 1×10^6 square mils; 1.27324×10^6 circular mils; 6.4516258×10^{-4} square meter; 6.4516258 square centimeters; 645.16258 square millimeters.

Square Inch (**in.^{2} or sq. in.**) (**British**). 6.4515898 square centimeters.

Square Kilometer (km^2).—0.3861006 square mile (U. S.); 247.1044 acres (U. S.); 247.1058 acres (British); 1.1960×10^6 square yards; 1.0764×10^7 square feet; 1×10^6 square meters.

Square Link (**li.^{2} or sq. li.**) (**Gunter's**).—1×10^{-5} acre; 1×10^{-4} square chain; 0.0016 square rod; 0.0484 square yard; 0.4356 square foot; 62.7264 square inches; 0.040469 square meter; 404.69 square centimeters.

Square Meter (m^2).—3.8610×10^{-7} square mile; 2.471044×10^{-4} acre (U. S.); 2.471058×10^{-4} acre (British); 0.00247104 square chain (Gunter's); 0.039537 square rod; 1.195985 square yards (U. S.); 1.195992 square yards (British); 10.76387 square feet (U. S.); 10.76390 square feet (British); 24.7104 square links (Gunter's); 1550.0 square inches; 1×10^{-6} square kilometer; 1×10^{-4} hectare or square hectometer; 0.01 are; 1 centare 1×10^4 square centimeters; 1×10^6 square millimeters.

Square Mil.—1×10^{-6} square inch; 1.2732 circular mils; 6.4516×10^{-6} square centimeter; 6.4516×10^{-4} square millimeter.

Square Mile (**mi.^{2} or sq. mi.**).—640 acres; 6400 square chains; 1.02400×10^5 square rods; 3.0976×10^6 square yards; 2.78784×10^7 square feet; 2.589998 square kilometers; 258.9998 hectares; 2.589998×10^6 square meters.

Square Millimeter (mm^2).—0.0015500 square inch; 1550.0 square mils; 1973.5 circular mils; 1×10^{-6} square meter; 0.01 square centimeter; 1.2732 circular millimeters.

Square Perch (British & U. S.).—1/160 or 0.00625 acre; 30.25 square yards; 25.293 square meters.

Square Pole (British).—30.25 square yards.

Square Rod (rd. ^{2} or sq. rd.).—9.765625×10^{-6} mile; 0.00625 acre; 0.0625 square chain (Gunter's); 30.25 square yards; 272.25 square feet; 625 square links (Gunter's); 3.9204×10^4 square inches; 0.0025293 hectare or square hectometer; 25.293 square meters or centares.

Square Yard (yd. ^{2} or sq. yd.) (U. S.).—3.22831×10^{-7} square mile; 2.06612×10^{-4} acre; 0.00206612 square chain; 0.0330579 square rod or square perch; 9 square feet; 20.6612 square link 1296 square inches; 8.36131×10^{-5} hectare; 0.0083613 square dekameter or are; 0.83613 square meter or centare; 8361.31 square centimeters.

Square Yard (yd. ^{2} or sq. yd.) (British).—2.0661×10^{-4} acre (British); 8.2645×10^{-4} rood (British); 0.836126 square meter.

Steradian.—$\frac{1}{4}\pi$ of the solid angle around a point; 0.07958 sphere; 0.15916 hemisphere; 0.6366 spherical right angle; 3282.8 square degrees.

Stere (s).—0.1 dekastere; 1 cubic meter; 10 decisteres; 999.973 liters.

Stone (British).—14 pounds (avoirdupois); 6.350 kilograms.

Strike (British).—2 bushels (dry); 0.072738 cubic meter.

Toise (French).—6 Paris feet; 1.9490365 meters (legal, 1799); 1.949090 meters (measured, 1887).

Ton (long) (tn. l.) (U. S. or British).—1.12000 tons (short); 22.400 hundredweights (short); 2240 pounds (avoirdupois); 2722.22 pounds (apothecary or troy); 3.5840×10^4 ounces (avoirdupois); 1.0160470 metric tons; 1016.0470 kilograms.

Ton (short) (tn. sh.) (U. S.).—0.89286 ton (long); 20 hundredweights (short); 2000 pounds (avoirdupois); 2430.56 pounds (apothecary or troy); 2.916666×10^4 ounces (apothecary or troy); 3.2000×10^4 ounces (avoirdupois); 0.907185 ton (metric); 907.185 kilograms.

Tonne (t) (metric ton, millier).—0.984206 ton (long); 1.10231 tons (short); 22.046223 hundredweights (short); 2204.62 pounds (avoirdupois); 2679.23 pounds (apothecary or troy); 3.527396×10^4 ounces (avoirdupois); 1000 kilograms; 1×10^6 grams.

Township (U. S.).—36 square miles; 2.3040×10^4 square yards; 93.240 square kilometers.

Tun.—252 gallons.

Week (wk.).—168 hours; 1.0080×10^4 minutes; 6.04800×10^5 seconds.

Wey (British, capacity).—*40 bushels.

Wey (British, mass).—*252 pounds.

Yard (yd.) (U. S.).—5.68182×10^{-4} mile; 0.00454545 furlong; 0.0454545 chain (Gunter's); 0.181818 rod; 3 feet; 4.54545 links (Gunter's); 36 inches; 3600/3937 or 0.91440183 meter; 91.440183 centimeters.

Yard (yd.) (British).—0.18182 pole (British); 4 quarters (British, linear); 0.9143992 meter (present legal equivalent of Imperial yard); 91.43992 centimeters; 1.420212×10^{6} wave lengths of red line of cadmium.

Year (yr.) (leap).—366 days; 8784 hours.

Year (yr.) (tropical, mean solar).—365.2422 day (mean solar); 8765.8128 hours (mean solar); 3.15569×10^{7} seconds (mean solar).

Year (yr.) (sidereal).—365.256 days (mean solar); 8766.144 hours (mean solar).

*Variable.

Reciprocal Units

x per **Ångström** = 1×10^{8} x per centimeter.

x per **circular mil** = 1.9735×10^{5} x per square centimeter.

x per **circular millimeter** = 127.324 x per square centimeter.

x per **circumference** = 0.159155 x per radian.

x per **cubic foot** = 3.5314×10^{-5} x per cubic centimeter.

x per **cubic inch** = 0.061023 x per cubic centimeter.

x per **cubic yard** = 1.3079 x per cubic meter.

x per **day (mean solar)** = 1.15741×10^{-5} x per second (mean solar).

x per **degree** = 57.29578 x per radian.

x per **entire space** = 0.079577 x per steradian.

x per **foot** = 0.032808 x per centimeter.

x per **gallon** (British) = 2.1997×10^{-4} x per cubic centimeter.

x per **gallon** (U. S.) = 2.6417×10^{-4} x per cubic centimeter.

x per **grain** = 0.01543236 x per milligram.

x per **hemisphere** = 0.15916 x per steradian.

x per **hour (mean solar)** = 2.77778×10^{-4} x per second (mean solar).

x per **inch** = 0.39370 x per centimeter.

x per **liter** = 9.9997×10^{-4} x per cubic centimeter.

x per **micron** = 1.0000×10^{4} x per centimeter.

x per **mil** = 393.70 x per centimeter.

x per **mile** = 0.62137 x per kilometer.

x per **minute** = 3437.75 x per radian.

x per **minute (mean solar)** = 0.0166667 x per second (mean solar).

x per **ounce (avoirdupois)** = 0.035274 x per gram.

x per **ounce (apothecary or troy)** = 0.032151 x per gram.

x per **ounce (fluid, British)** = 0.035195 x per cubic centimeter.

x per **ounce (fluid, U. S.)** = 0.033814 x per cubic centimeter.

x per **pound (avoirdupois)** = 0.00220462 x per gram.

x per **quart (dry, U. S.)** = 9.0808×10^{-4} x per cubic centimeter.

x per **quart (liquid, U. S.)** = 0.0010567 x per cubic centimeter.

x per **quart (British)** = 8.7988×10^{-4} x per cubic centimeter.

x per **second** = 2.06265×10^{5} x per radian.

x per **second (sidereal)** = 1.002738 x per second (mean solar).

x per **square degree** = 3282.8 x per steradian.

x per **square foot** = 0.0010764 x per square centimeter.

x per **square inch** = 0.15500 x per square centimeter.

x per **square meter** = 1×10^{-4} x per square centimeter.

x per **square mile** = 0.38610 x per square kilometer.

x per **square millimeter** = 100.0000 x per square centimeter.

x per **square yard** = 1.19599×10^{-4} x per square centimeter.

x per **ton (2000 pounds)** = 0.00110231 x per kilogram.

x per **ton (2240 pounds)** = 9.8421×10^{-4} x per kilogram.

x per **year (mean solar)** = 0.00273791 x per day (mean solar) = 3.16888×10^{-8} x per second (mean solar).

Velocity $[lt^{-1}]$

Centimeter per second.—3.728×10^{-4} mile per minute; 0.02237 mile per hour; 0.032808 foot per second; 0.03600 kilometer per hour; 0.6000 meter per minute; 1.9685 feet per minute.

Degree per second.—0.002778 revolution per second; 0.017453 radian per second; 0.1667 revolution per minute.

Foot per minute.—0.005080 meter per second; 0.011364 mile per hour; 0.016667 foot per second; 0.01829 kilometer per hour; 0.3048 meter per minute; 0.5080 centimeter per second.

Foot per second.—0.011364 mile per minute; 0.5921 knot per hour; 0.6818 mile per hour; 1.0973 kilometers per hour; 18.29 meters per minute; 30.4801 centimeters per second.

Kilometer per hour.—0.016667 kilometer per minute; 0.27778 meter per second; 0.5396 knot per hour; 0.6214 mile per hour; 0.9113 foot per second; 16.67 meters per minute; 27.7778 centimeters per second; 54.68 feet per minute.

Kilometer per minute.—0.6215 mile per minute; 37.284 miles per hour; 60 kilometers per hour; 1666.7 centimeters per second; 3280.8 feet per minute.

Knot (per hour).—1.152 miles per hour; 1.689 feet per second; 1.853 kilometers per hour; 51.48 centimeters per second; 6080.20 feet per hour.

Meter per minute.—0.03728 mile per hour; 0.05468 foot per second; 0.06 kilometer per hour; 1.6667 centimeters per second; 3.281 feet per minute.

Meter per second.—0.03728 mile per minute; 0.06000 kilometer per minute; 2.2369 miles per hour; 3.281 feet per second; 3.600 kilometers per hour; 196.8 feet per minute.

Mile per hour.—0.016667 mile per minute; 0.8684 knot per hour; 1.4667 feet per second; 1.6093 kilometers per hour; 26.82 meters per minute; 44.7041 centimeters per second; 88 feet per minute.

Mile per minute.—0.8684 knot per minute; 1.609 kilometers per minute; 60 miles per hour; 88 feet per second; 2682.2 centimeters per second.

Radian per second.—0.1592 revolution per second; 9.549 revolutions per minute; 57.296 degrees per second.

Revolution per day.—7.2722×10^{-5} radian per second.

Revolution per minute (R.P.M.).—0.01667 revolution per second; 0.10472 radian per second; 6 degrees per second.

Revolution per second.—6.2832 radians per second; 60 revoutions per minute; 360 degrees per second.

Velocity of light.—2.9986×10^{10} centimeters per second.

Acceleration $[l\ t^{-2}]$

Centimeter per second per second.—0.02237 mile per hour per second; 0.03281 foot per second per second; 0.03600 kilometer per hour per second.

Foot per second per second.—0.304801 meter per second per second; 0.6818 mile per hour per second; 1.097 kilometer per hour per second; 30.4801 centimeter per second per second.

Gravity, standard.—32.174 feet per second per second; 980.665 centimeters per second per second.

Kilometer per hour per second.—0.27778 meter per second per second; 0.6214 mile per hour per second; 0.9133 foot per second per second; 27.778 centimeters per second per second.

Meter per second per second.—2.237 miles per hour per second; 3.2808 feet per second per second; 3.600 kilometers per hour per second; 100.00 centimeters per second per second.

Mile per hour per minute.—0.74507 centimeter per second per second.

Mile per hour per second.—0.44704 meter per second per second; 1.467 feet per second per second; 1.609 kilometers per hour per second; 44.704 centimeters per second per second.

Radians per second per second.—0.1592 revolution per second per second; 9.549 revolutions per minute per second; 572.96 revolutions per minute per minute.

Revolution per minute per second.—0.10420 radian per second per second.

Revolution per minute per minute.—2.778×10^{-4} revolution per second per second; 0.0017453 radian per second per second; 0.01667 revolution per minute per second.

Revolution per second per second.—6.2832 radians per second per second; 60 revolutions per minute per second; 3600 revolutions per minute per minute.

Density $[m\ l^{-3}]$

Demal.—1 gram equivalent per cubic decimeter.

Grain per cubic foot.—2.288 grams per cubic meter.

Gram per cubic centimeter.—3.405×10^{-7} pound per milfoot; 0.03613 pound per cubic inch; 8.3452 pounds per gallon

(U. S.); 10.022 pounds per gallon (British); 62.43 pounds per cubic foot.

Gram per cubic meter.—1.437 grains per cubic foot.

Gram per milliliter.—(Numerically equal to specific gravity t°/4°); 0.999973 gram per cubic centimeter.

Kilogram per cubic meter.—3.613×10^{-5} pound per cubic inch; 0.001 gram per cubic centimeter; 0.06243 pound per cubic foot.

Mercury at 0°C.—13.5951 grams per cubic centimeter (Internationally accepted conventional value to be used in expressing pressures in terms of columns of mercury.)

Pound per cubic foot.—5.787×10^{-4} pound per cubic inch; 0.016018 gram per cubic centimeter; 16.018 kilograms per cubic meter.

Pound per cubic inch.—27.680 grams per cubic centimeter; 2.768×10^{4} kilograms per cubic meter.

Pound per mil foot.—2.9369×10^{6} grams per cubic centimeter.

Pound per gallon (U. S.).—0.119826 gram per cubic centimeter.

Pound per gallon (British).—0.099776 gram per cubic centimeter.

Slug per cubic foot.—0.5154 gram per cubic centimeter.

Mass Concentration

Gram per metric ton.—1.0000 milligram per kilogram.

Gram per ton (2000 pound).—1.1023 milligrams per kilogram.

Gram per ton (2240 pound).—0.9842 milligram per kilogram.

Karat (1 of gold to 24 of mixture).—41.667 milligrams per gram.

Milligram per assay ton (Equals one troy ounce per 2000 pound (avoirdupois).)—34.276 milligrams per kilogram.

Milligram per kilogram.—0.002 pound (avoirdupois) per ton (2000 pound); 0.029175 milligram per assay ton; 0.032000 ounce (avoirdupois) per ton (2000 pound); 1 gram per metric ton.

Ounce (avoirdupois) **per ton** (2000 pound.).—31.2500 milligrams per kilogram.

Ounce (avoirdupois) per ton (2240 pound).—27.9018 milligrams per kilogram.

Pound (avoirdupois) per ton (2000 pound).—500.000 milligrams per kilogram.

Pound (avoirdupois) per ton (2240 pound).—446.429 milligrams per kilogram.

Flow $[l^3t^{-1}]$

Cubic centimeter per second.—0.0021186 cubic foot per minute.

Cubic foot per minute.—0.1247 gallon per second; 0.4720 liter per second; 62.4 pounds of water per minute; 472.0 cubic centimeters per second.

Cubic foot per second.—2.2222 cubic yards per minute; 448.83 gallons per minute; 1699.3 liters per minute.

Cubic yard per minute.—0.45 cubic foot per second; 3.367 gallons per second; 12.74 liters per second.

Gallon per second.—0.297 cubic yard per minute; 8.0192 cubic feet per minute.

Gallon per minute.—0.002228 cubic foot per second; 0.06308 liter per second.

Liter per minute.—5.885×10^{-4} cubic foot per second; 0.004403 gallon per second.

Liter per second.—0.078493 cubic yard per minute; 2.12 cubic feet per minute; 15.85 gallons per minute (U. S.).

Miner's Inch.—1.2 cubic feet per minute.

Pounds of water per minute.—0.01603 cubic foot per minute.

Force $[mlt^{-2}]$

Conversion factors between the absolute and gravitational units of force, torque, energy and power are dependent on the value of g, the acceleration due to gravity. The standard value of g adopted by the International Committee on Weights and Measures is 980.665 cm / sec^2. This value or its equivalent, 32.174 ft. / sec^2, is used except where otherwise noted.

Dyne.—2.2481×10^{-6} pound weight; 7.2330×10^{-5} poundal; 0.0010197 gram weight; 0.015737 grain weight.

Grain weight.—63.546 dynes.

Gram weight—0.070932 poundal; 980.665 dynes.

Kilogram weight.—70.932 poundals; 9.80665×10^5 dynes.

Poundal.—0.031081 pound weight; 14.098 grams weight; 1.3825×10^4 dynes.

Pound weight.—32.174 poundals; 453.59 grams weight; 4.4482×10^5 dynes.

Ton weight (2000 pound).—8.8964×10^8 dynes.

Ton weight (2240 pound).—9.9640×10^8 dynes.

Reciprocal Force $[m^{-1} l^{-1} t^2]$

x per **gram weight**$=0.0010197$ x per dyne.

x per **poundal**$=7.2330 \times 10^{-5}$ x per dyne.

x per **pound weight**$=2.2481 \times 10^{-6}$ x per dyne.

Pressure $[m\, l^{-1} t^{-2}]$

Atmosphere (normal).—Pressure exerted by 76 cm of Hg, density 13.5951 g / cm³, $g=980.665$ cm / sec²; 0.0073480 ton (2000 pound) per square inch; 1.0133 bars; 1.0581 tons (2000 pound) per square foot; 14.696 pounds per square inch; 29.921 inches of mercury at 32° F; 33.899 feet of water at 39.1° F; 760 millimeters of mercury at 0° C; 1033.2 grams per square centimeter; 2116.2 pounds per square foot; 1.0332×10^4 kilograms per square meter; 1.01325×10^6 dynes per square centimeter.

Bar.—0.98692 atmosphere; 14.504 pounds per square inch, 1.01971×10^4 kilograms per square meter; 1.000×10^6 dynes per square centimeter. (This value accords with the only internationally accepted use of this term; but "bar" has also been used to denote a pressure of one dyne per square centimeter).

Barye.—1.0000 dyne per square centimeter.

Centimeter of mercury at 0°C.—0.013158 atmosphere; 0.19337 pound per square inch; 0.44604 foot of water; 27.845 pounds per square foot; 135.95 kilograms per square meter; 1.33322×10^4 dynes per square centimeter.

Centimeter of water at 4°C.—980.638 dynes per square centimeter.

Dyne per square centimeter.—9.8692×10^{-7} atmosphere; 1×10^{-6} bar; 1.4504×10^{-5} pound per square inch; 2.9530×10^{-5} inch of mercury at 32°F; 4.0148×10^{-4} inch of water at 4°C; 7.5006×10^{-4} millimeter of mercury; 0.00101971 gram per square centimeter; 0.00101974 centimeter of water at 4°C; 0.0020886 pound per square foot; 0.0101971 kilogram per square meter.

Foot of water at 4°C or 39.1°F.—0.029499 atmosphere; 0.43352 pound per square inch; 0.88265 inch of mercury at

32 °F; 62.426 pounds per square foot; 304.79 kilograms per square meter.

Gram (weight) per square centimeter.—9.6784×10^{-4} atmosphere; 0.014223 pound per square inch; 0.73556 millimeter of mercury at 0 °C; 2.0482 pound per square foot; 10 kilograms per square meter; 980.665 dynes per square centimeter.

Inch of mercury at 32 °F.—0.033421 atmosphere; 0.49116 pound per square inch; 1.13299 feet of water at 39.1 °F; 13.595 inches of water at 4 °C; 70.727 pounds per square foot; 345.31 kilograms per square meter; 3.38639×10^{4} dynes per square centimeter.

Inch of water at 4 °C.—0.0024583 atmosphere; 0.036136 pound per square inch; 0.073554 inch of mercury; 0.57818 ounce per square inch; 5.2022 pounds per square foot; 25.399 kilograms per square meter; 2490.82 dynes per square centimeter.

Kilogram (weight) per square centimeter.—14.223 pounds per square inch; 73.556 centimeters of mercury at 0 °C; 980,665 dynes per square centimeter.

Kilogram (weight) per square meter.—9.6784×10^{-5} atmosphere; 0.0014223 pound per square inch; 0.0028959 inch of mercury; 0.0032809 foot of water; 0.073556 millimeter of mercury; 0.1 gram per square centimeter; 0.20482 pound per square foot; 98.0665 dyne per square centimeter.

Kilogram (weight) per square millimeter.—0.71114 ton (2000 pounds) per square inch; 1×10^{6} kilograms per square meter; 9.80665×10^{7} dynes per square centimeter.

Millimeter of mercury at 0 °C.—0.0013158 atmosphere; 0.019337 pound per square inch; 1.3595 grams per square centimeter; 2.7845 pounds per square foot; 13.595 kilograms per square meter; 1333.22 dynes per square centimeter.

Ounce (weight) per square inch.—0.0625 pound per square inch; 4309.2 dynes per square centimeter.

Pound (weight) per square foot.—4.7254×10^{-4} atmosphere; 4.7880×10^{-4} bar; 0.0069445 pound per square inch; 0.016018 foot of water at 39.1 °F; 0.35913 millimeter of mercury at 0 °C; 0.48824 gram per square centimeter; 4.8824 kilograms per square meter; 478.80 dynes per square centimeter.

Pound (weight) per square inch.—5×10^{-4} ton (2000 pound) per square inch; 0.068046 atmosphere; 0.068947 bar; 0.070307 kilogram per square centimeter; 2.0360 inches of mercury at 32 °F; 2.3066 feet of water at 39.1 °F; 5.1715 centimeters of mercury at 0 °C; 27.673 inches of water at 4 °C; 51.715 millimeters of mercury; 70.307 grams per square centimeter; 703.07 kilograms per square meter; 6.8947×10^{4} dynes per square centimeter.

Ton (2000 pound) (weight) per square foot.—0.94509 atmosphere; 13.889 pounds per square inch; 9764.8 kilograms per square meter; 9.5760×10^5 dynes per square centimeter.

Ton (2240 pound) (weight) per square foot.—10.7251×10^5 dynes per square centimeter.

Ton (2000 pound) (weight) per square inch.—1.4062 kilograms per square millimeter; 2000 pounds per square inch; 1.4062×10^6 kilograms per square meter; 1.3789×10^8 dynes per square centimeter.

Ton (2240 pound) (weight) per square inch.—1.5749 kilograms per square millimeter; 152.42 atmospheres; 1.5444×10^8 dynes per square centimeter.

Work and Energy $[m\ l^2\ t^{-2}]$

British thermal unit (mean) (BTU).—2.930×10^{-4} kilowatt-hour; 3.9292×10^{-4} horse power-hour; 0.25198 kilogram-calorie or large calorie (mean); 0.2930 watt-hour; 10.409 liter-atmospheres; 107.56 kilogram-meters; 251.98 gram-calories (mean); 777.97 foot-pounds; 1054.8 joules (absolute); 3676 cubic foot-atmospheres; 2.5030×10^4 foot-poundals; 1.0548×10^{10} ergs.

British thermal unit (39 °F) (BTU).—1060.4 joules (absolute).

British thermal unit (60 °F) (BTU).—1054.6 joules (absolute).

Calorie.—*See* gram-calorie or kilogram-calorie.

Centigrade thermal unit (15 °C) (CTU).—1898.3 joules (absolute).

Centimeter-dyne.—*See* erg.

Centimeter-gram force.—*See* gram-centimeter.

Cheval-vapeur heure.—2.6478×10^6 joules (absolute).

Cubic centimeter-atmosphere (normal).—0.101325 joule (absolute).

Cubic foot atmosphere.—2.7203×10^{-4} British thermal unit (mean); 28.313 liter-atmospheres; 292.59 kilogram-meters; 680.74 gram-calories (mean); 2116.3 foot-pounds; 2869.4 joules (absolute).

Erg.—2.3889×10^{-11} kilogram-calorie (mean); 9.4805×10^{-11} British thermal unit (mean); 1.0197×10^{-8} kilogram-meter; 2.3889×10^{-8} gram-calorie (mean); 7.3756×10^{-8} foot-pound; 1×10^{-7} joule; 2.3730×10^{-6} foot-poundal; 0.0010197 gram-centimeter; 1 dyne-centimeter.

Foot-Pound.—3.7662×10^{-7} kilowatt-hour; 5.0505×10^{-7} horse power-hour; 3.2389×10^{-4} kilogram-calorie (mean); 3.7662×10^{-4} watt-hour; 4.7253×10^{-4} cubic foot-atmosphere; 0.0012854 Brit-

ish thermal unit (mean); 0.013381 liter-atmosphere; 0.138255 kilogram-meter; 0.32389 gram-calorie (mean); 1.35582 joule (absolute); 32.174 foot-poundals; 1.3825×10^4 gram-centimeters; 1.35582×10^7 ergs or centimeter-dynes.

Foot-poundal.—3.9952×10^{-5} British thermal unit (mean); 4.1589×10^{-4} liter-atmosphere (normal); 0.0042972 kilogram-meter; 0.010067 gram-calorie; 0.031081 foot-pound; 0.042140 joule; 4.21402×10^5 ergs.

Gram-calorie (mean).—1.5593×10^{-6} horse power hours; 0.001 kilogram-calorie; 0.0011628 watt-hour; 0.001469 cubic foot-atmosphere; 0.0039685 British thermal unit (mean); 0.041311 liter-atmosphere; 0.42685 kilogram-meter; 3.0874 foot-pounds; 4.186 joules (absolute); 99.334 foot-poundals.

Gram-calorie (15 °C).—4.185 joules (absolute).

Gram-calorie (20 °C).—4.181 joules (absolute).

Gram-centimeter.—2.3427×10^{-8} kilogram-calorie (mean); 9.2972×10^{-8} British thermal unit (mean); 1×10^{-5} kilogram-meter; 2.3427×10^{-5} gram-calorie (mean); 7.233×10^{-5} foot-pound; 9.80665×10^{-5} joule (absolute); 980.7 ergs.

Horse power hour. (**HP hr. or h. p. hr.**).—0.7457 kilowatt-hour; 641.30 kilogram-calories (mean); 745.7 watt-hours; 2545.0 British thermal units (mean); 2.7374×10^5 kilogram-meters; 1.9800×10^6 foot-pounds; 2.6845×10^6 joules (absolute).

Horse power hour (electrical, U. S. & British).—2.6856×10^6 joules (absolute).

International volt (v) electronic charge).—1.5927×10^{-19} joule (absolute).

International volt (v) Faraday.—9.6541×10^4 joules (absolute).

Joule (absolute).—2.778×10^{-7} kilowatt-hour; 3.725×10^{-7} horse power-hour; 2.3889×10^{-4} kilogram-calorie (mean); 2.778×10^{-4} watt-hour; 3.485×10^{-4} cubic foot-atmosphere; 9.480×10^{-4} British thermal unit (mean); 0.009869 liter-atmosphere; 0.10197 kilogram-meter; 0.23889 gram-calorie (mean); 0.23895 gram-calorie at 15 °C; 0.23918 gram-calorie at 20 °C; 0.73756 foot-pound; 0.999680 joule (International); 1 watt-second; 23.730 foot-poundals; 1.0197×10^4 gram-centimeters; 1×10^7 ergs.

Joule (International) (v).—1.00032 joule (absolute).

Kilogram-calorie or large calorie (mean).—0.0011628 kilowatt-hour; 0.0015593 horse power-hour; 1.1628 watt-hour; 3.9685 British thermal units (mean); 426.85 kilogram-meters; 1000 small or gram-calories; 3087.4 foot-pounds; 4186 joules; 4.2686×10^7 gram-centimeters; 4.186×10^{10} ergs.

Kilogram-meter.—2.7235×10^{-6} kilowatt hour; 3.6530×10^{-6}

horse power-hour; 0.0027235 watt-hour; 0.0034177 cubic foot-atmosphere; 0.0092972 British thermal unit (mean); 0.096782 liter-atmosphere; 2.3427 gram-calories (mean); 7.2330 foot-pounds; 9.80665 joules (absolute); 232.71 foot-poundals; 1×10^5 gram-centimeters; 9.80665×10^7 ergs.

Kilowatt-hour.—1.3410 horse power-hours; 1000 watt-hours; 3413.0 British thermal units (mean); 3.6710×10^5 kilogram-meters; 8.6001×10^5 gram-calories (mean); 2.6552×10^6 foot-pounds; 3.6000×10^6 joules (absolute).

Large Calorie.—*See* kilogram-calorie.

Liter-atmosphere (normal).—3.7745×10^{-5} horse power-hour; 0.035319 cubic foot-atmosphere; 0.09607 British thermal unit (mean); 10.333 kilogram-meters; 24.206 gram-calories (mean); 74.735 foot-pounds; 101.328 joules (absolute); 2404.5 foot-poundals.

Liter-atmosphere (lat. 45°, g=980.616).—101.323 joules (absolute).

Megalerg.—1×10^6 ergs.

Meter-kilogram.—*See* kilogram-meter.

Watt-hour.—0.001 kilowatt-hour; 0.0013410 horse power-hour; 0.86001 kilogram-calorie (mean); 3.4130 British thermal units (mean); 367.10 kilogram-meters; 860.01 gram-calories (mean); 2655.3 foot-pounds; 3600 joules.

Power $[m\, l^2\, t^{-3}]$

British thermal unit (BTU) (mean) per minute.—0.023575 horse power; 17.580 watts (absolute).

British thermal unit (BTU) (mean) per second.—1.4145 horse power; 1054.8 watts (absolute).

British thermal unit (BTU) (39 °F) per second.—1060.4 watts (absolute).

British thermal unit (BTU) (60 °F) per second.—1054.6 watts (absolute).

Cheval-vapeur.—For electrical purposes usually used as 736 watts. *See* Force de cheval.

Erg per second.—1×10^{-10} kilowatt; 1.3412×10^{-10} horse power; 1.4333×10^{-9} kilogram-calorie (mean) per minute; 5.688×10^{-9} British thermal unit (mean) per minute; 7.3756×10^{-8} foot-pound per second; 1×10^{-7} watt; 4.4254×10^{-6} foot-pound per minute; 1 dyne-centimeter per second.

Foot-pound per minute.—2.2597×10^{-5} kilowatt; 3.0303×10^{-5} horse power; 3.072×10^{-5} horse power (metric); 3.2389×10^{-4}

kilogram-calorie (mean) per minute; 0.0012854 British thermal unit (mean) per minute; 0.016667 foot-pound per second 0.022597 watt.

Foot-pound per second.—0.0013558 kilowatt; 0.0018182 horse power; 0.019433 kilogram-calorie (mean) per minute 0.077124 British thermal unit (mean) per minute; 1.35582 watt (absolute).

Force de cheval (cheval-vapeur).—*See* horse power (metric).

Gram-centimeter per second.—9.80665×10^{-5} watt (absolute).

Hectowatt.—100 watts.

Horse power (h. p. or HP).—0.70696 British thermal unit (mean) per second; 0.7452 kilowatt ($g=980$); 0.74570 ($g=980.665$) kilowatt; 1.0139 horse power (metric) or cheval-vapeur. 10.688 kilogram-calories (mean) per minute; 42.418 British thermal units (mean) per minute; 550 foot-pounds per second; 745.2 watts ($g=980$); 745.70 watts ($g=980.665$); 3.3000×10^4 foot-pounds per minute.

Horse power, electrical (U. S. & British).—746.00 watt (absolute) (Commonly used in rating electrical machinery).

Horse power, metric (cheval vapeur).—0.98632 horse power (U. S.); 75 kilogram-meters per second; 735.499 watts; 3.2549×10^4 foot-pounds per minute.

Kilogram-calorie (mean) per minute.—0.093557 horse power; 51.457 foot-pounds per second; 69.767 watts.

Kilogram calorie (mean) per second.—4.186 kilowatts.

Kilogram-meter per second.—9.80665 watts (absolute).

Kilowatt.—0.23889 kilogram-calorie (mean) per second; 0.94827 British thermal unit (mean) per second; 1.3410 horse power; 1.3597 horse power (metric); 14.333 kilogram-calories (mean) per minute; 56.896 British thermal units (mean) per minute; 737.56 foot-pounds per second; 1000 watts; 4.4254×10^4 foot-pounds per minute; 2.6552×10^6 foot-pounds per hour.

Lumen.—0.001496 watt.

Metric horse power.—*See* horse power, metric.

Watt (absolute).—0.001 kilowatt; 0.0013410 horse power; 0.0013596 force de cheval or horse power (metric); 0.01433 kilogram-calorie (mean) per minute; 0.056896 British thermal unit (mean) per minute; 0.73756 foot-pound per second; 1 joule per second; 44.254 foot-pounds per minute; 1×10^7 ergs per second.

Watt (International) (v).—1.00032 watt (absolute).

Watt of maximum visibility radiation.—668 lumens.

Action $[m\, l^2\, t^{-1}]$

Calorie (15 °C) second.—6.3854×10^{33} quanta.

Calorie (15 °C) second / N_o *—1.0535×10^{10} quanta.

Joule second.—1.5258×10^{33} quanta.

Joule second / N_o *.—2.5173×10^{9} quanta.

Planck's quantum.—6.554×10^{-27} erg second.

Volt electronic-charge second.—2.4292×10^{14} quanta.

Volt faraday second.—1.4724×10^{38} quanta.

*N_o denotes Avogadro's number, the number of molecules per gram mole.

Torque or Moment of Force $[m\, l^2\, t^{-2}]$

Dyne-centimeter.—1.0197×10^{-8} kilogram-meter; 7.3757×10^{-8} pound-foot; 8.8511×10^{-7} pound-inch; 2.3731×10^{-6} poundal-foot.

Kilogram-meter.—9.8066×10^{7} dyne-centimeters.

Pound-foot.—1.3558×10^{7} dyne-centimeters.

Poundal-foot.—4.2140×10^{5} dyne-centimeters.

Pound-inch.—1.1298×10^{6} dyne-centimeters.

Moment of Area $[l^4]$

Square centimeter-centimeter squared.—0.02402 square inch-inch squared.

Square foot-foot squared.—2.074×10^{4} square inch-inch squared.

Square inch-inch squared.—4.823×10^{-5} square foot-foot squared; 41.62 square centimeter-centimeter squared.

Moment of Inertia $[m\, l^2]$

Gram-centimeter squared ($g\, cm^2$).—2.3730×10^{-6} pound-foot squared; 3.4172×10^{-4} pound-inch squared.

Kilogram-centimeter squared.—0.0023730 pound-foot squared; 0.3417 pound-inch squared.

Pound-foot squared.—144 pound-inches squared; 421.40 kilogram-centimeters squared; 4.2140×10^{5} gram-centimeters squared.

Pound-inch squared.—0.006945 pound-foot squared; 2.9264 kilogram-centimeters squared; 2926.4 gram-centimeters squared.

Thermal Units

Temperature

Degree Centigrade (°C).—0.8 or 4 / 5 degree Réaumur; 1.00 degree absolute, Kelvin; 1.8 or 9 /5 degrees Fahrenheit.

Degree Fahrenheit (°F).—0.44444 or 4 /9 degree Réaumur; 0.55556 or 5 /9 degree Centigrade.

Degree Réaumur (°R).—1.25 or 5 /4 degrees Centigrade; 2.25 or 9 /4 degrees Fahrenheit.

Temperature, absolute Centigrade or Kelvin (K) scale.—$x°\ K = T\ °C + 273.18$.

Temperature, degrees Centigrade (°C).—$x\,°C = 5/9\ (T\,°F - 32)$; $x\,°C = 5/4\ T\,°R$.

Temperature, degrees Fahrenheit (°F).—$x\,°F = 9/5\ T\,°C + 32$; $x\,°F = 9/4\ T\,°R + 32$.

Temperature, degrees Réaumur (°R).—$x\,°R = 4/9\ (T\,°F - 32)$; $x\,°R = 4/5\ T\,°C$.

Thermal Capacity of a Substance

British thermal unit (mean) **per pound per °F.**—1 gram-calorie per gram per °C; 4.186 joules per gram per °C.

Gram-calorie (mean) **per gram per °C.**—1 British thermal unit (60 °F) per pound per °F; 4.186 joules per gram per °C.

Joule per gram per °C.—0.2389 gram-calorie (mean) per gram per °C; 0.2389 British thermal unit (mean) per pound per °F.

Thermal Capacity of a Body. Water Equivalent

British thermal unit (60 °F) **per °F.**—453.59 gram-calories per °C; 1898.3 joules per °C.

Gram-calorie (15°) **per °C.**—0.0022046 British thermal unit (60 °F) per °F; 4.185 joules per °C.

Joule per °C.—5.268×10^{-4} British thermal unit (60 °F) per °F; 0.2389 gram-calorie per °C.

Heat Equivalent. Latent Heat

British thermal unit (mean) **per pound.**—0.5556 gram-calorie (mean) per gram; 2.325 joules per gram.

Gram-calories (mean) per gram.—1.8 British thermal units (mean) per pound; 4.186 joules per gram.

Joule per gram.—0.2389 gram-calories (mean) per gram; 0.4301 British thermal unit per pound.

Thermal Conductivity

British thermal unit (mean) per square foot per second for a temperature gradient of 1 °F per inch=5.191 joules (absolute) per square centimeter per second for a temperature gradient of 1 °C per centimeter=1.2404 gram-calories (15 °C) per square centimeter per second for a temperature gradient of 1 °C per centimeter.

Gram-calorie (15 °C) per square centimeter per second for a temperature gradient of 1 °C per centimeter=4.185 joules (absolute) per square centimeter per second for a temperature gradient of 1 °C per centimeter=0.80620 British thermal units (mean) per square foot per second for a temperature gradient of 1 °F per inch.

Joule per square centimeter per second for a temperature gradient of 1 °C per centimeter=0.2389 gram-calorie (15 °C) per square centimeter per second for a temperature gradient of 1 °C per centimeter=0.1926 British thermal unit per square foot per second for a temperature gradient of 1 °F per inch.

Photometric Units

Bougie Decimale (intensity of source).—1.0 International candle (approximately).

Candle (International) (intensity of source).—0.104 Carcel unit (approximately); 1.0000 International lumen per steradian; 1 Pentane candle (approximately); 1 English sperm candle (approximately); 1.11 Hefner unit (approximately).

Candle per square centimeter (surface brightness).—3.1416 lamberts; 3141.6 millilamberts.

Candle per square inch (surface brightness).—0.48695 lambert; 486.95 millilamberts.

Carcel unit (intensity of source).—9.6 International candle (approximately).

English sperm candle (intensity of source).—1.0 International candle (approximately).

Foot-candle (illumination of a surface).—1 lumen incident per square foot; 1.0764 milliphots; 10.764 lumen per square meter; 10.764 lux.

Hefner unit (intensity of source).—0.90 International candle (approximately).

Lambert (surface brightness).—0.3183 candle per square centimeter; 2.054 candles per square inch; 1 lumen emitted per square centimeter of a perfectly diffusing surface.

Lumen (flux of luminous energy).—Is emitted by 0.07958 spherical candle power. A source of one spherical candle power emits 4π or 12.566 lumens.

Lumen per square centimeter per steradian (surface brightness).—3.1416 lambert.

Lumen per square foot (illumination of a surface).—1 foot-candle; 10.764 lumens per square meter.

Lumen per square foot per steradian (surface brightness).—3.3816 millilambert.

Lumen per square meter (surface illumination).—1×10^{-4} phot; 0.092902 foot candle or lumen per square foot.

Lux (illumination of a surface).—1×10^{-4} phot; 0.1 milliphot; 0.092902 foot-candle; 1.000 lumen per square meter.

Meter-candle (illumination of a surface).—1.000 lumen per square meter.

Millilambert (surface brightness).—0.929 lumen emitted per square foot (perfect diffusion).

Milliphot (illumination of a surface).—0.001 phot; 0.929 foot-candle.

Pentane candle (intensity of source).—1.0 International candle (approximately).

Phot (illumination of a surface).—1 lumen incident per square centimeter; 1000 milliphots; 1.000×10^4 lumens per square meter; 1×10^4 lux.

Stilb (surface brightness).—1 candle per square centimeter.

Viscosity

Viscosity $[ml^{-1} t^{-1}]$

Gram weight second per square centimeter.—980.665 poise.

Poise.—1.00 gram per centimeter per second.

Pound weight second per square foot.—478.8 poise.

Pound weight second per square inch.—6.895×10^4 poise.

Kinematic Viscosity $[l^2 t^{-1}]$

Inch squared per second.—6.451 centimeters squared per second.

Poise centimeter cubed per gram.—1.000 centimeter squared per second.

Poise foot cubed per pound.—62.43 centimeters squared per second.

Poise inch cubed per gram.—16.387 centimeters squared per second.

Reciprocal Viscosity (Fluidity) [$m^{-1} lt$]

Rhe.—1.000 per poise.

Diffusivity; Coefficient of Diffusion [$l^2 t^{-1}$]

Centimeter squared per day.—1.1574×10^{-5} centimeter squared per second.

Inch squared per second.—6.4516 centimeters squared per second.

Liter per centimeter per day.—0.011574 centimeter squared per second.

Surface Tension [mt^{-2}]

Dyne per centimeter.—0.01 erg per square millimeter; 0.10197 milligram weight per millimeter; 1 erg per square centimeter; 2.5901 milligram weight per inch.

Erg per square centimeter.—0.01000 erg per square millimeter; 1.0000 dyne per centimeter.

Erg per square millimeter.—100.00 dynes per centimeter; 100.00 ergs per square centimeter.

Milligram weight per inch.—0.38609 dyne per centimeter.

Milligram weight per millimeter.—9.80665 dynes per centimeter.

Rotatory Power [l^{-1}]

Degree per centimeter.—0.017453 radian per centimeter.

Degree per foot.—5.7261×10^{-4} radian per centimeter.

Degree per inch.—0.0068714 radian per centimeter.

Minute per centimeter.—2.9089×10^{-4} radian per centimeter.

Radian per centimeter.—57.296 degrees per centimeter; 145.50 degrees per inch; 1746.4 degrees per foot; 3437.7 minutes per centimeter.

ELECTRICAL UNITS

Electrical units are designated as "absolute" when based on the electromagnetic cgs system; "International" when based on legal definitions of the ohm, Weston cell or silver voltammeter.

The basis of International units is indicated as follows: "(a)" based on a silver deposit of 1.11800 mg per International ampere second; "(v)" based on the International ohm and Weston cell,—1.018300 volts at 20 °C.

Quantity or Charge $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}t^{-1}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}]$

Abcoulomb.—*See* electromagnetic cgs unit electrical quantity.

Ampere-hour (absolute).—3600.0 coulomb (absolute).

Coulomb (absolute).—0.1000 electromagnetic cgs unit or abcoulomb; 1.00007 International coulombs (a); 1.00010 International coulombs (v); 2.99796×10^{9} electrostatic cgs units or statcoulombs; 6.281×10^{18} electronic charges.

Electromagnetic cgs unit or abcoulomb.—10.0000 coulombs (absolute); 2.99796×10^{10} electrostatic cgs units or statcoulombs.

Electronic charge.—1.5921×10^{-20} electromagnetic cgs unit or abcoulomb; 1.5921×10^{-19} coulomb (absolute); 4.774×10^{-10} electrostatic cgs unit or statcoulomb.

Electrostatic cgs unit or statcoulomb.—3.33560×10^{-11} electromagnetic cgs unit or abcoulomb; 3.33560×10^{-10} coulomb (absolute); 2.0947×10^{9} electronic charges.

Electrostatic foot-pound second unit.—1.1952×10^{-6} coulomb (absolute); 117.58 electromagnetic cgs units or abcoulombs; 3583.9 electrostatic cgs units or statcoulombs.

Faraday.—9.6500×10^{4} coulombs (absolute); 9.6507×10^{4} International coulombs (a); 9.6510×10^{4} International coulombs (v); 2.89365×10^{14} electrostatic cgs units or statcoulombs.

International coulomb (a).—0.99993 coulomb (absolute).

International coulomb (v).—0.99990 coulomb (absolute).

Statcoulomb.—*See* electrostatic cgs unit.

Reciprocal Quantity $[\epsilon^{-\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{3}{2}}t]$; $[\mu^{\frac{1}{2}}m^{-\frac{1}{2}}l^{-\frac{1}{2}}]$

x per **ampere-hour** = 2.7778×10^{-4} x per coulomb (absolute).

x per **coulomb (absolute)** = 0.99990 x per International coulomb (v); 0.99993 x per International coulomb (a).

x per **electromagnetic cgs unit**$=0.1000$ x per coulomb (absolute).

x per **electronic charge**$=6.281\times10^{18}$ x per coulomb (absolute).

x per **electrostatic cgs unit**$=2.99796\times10^{9}$ x per coulomb (absolute).

x per **faraday**$=1.0363\times10^{-5}$ x per coulomb (absolute).

Current $[\epsilon^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}t^{-2}]$; $[\mu^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$

Abampere.—*See* electromagnetic cgs unit.

Ampere (absolute).—1.0363×10^{-5} faraday per second; 0.1 electromagnetic cgs unit or abampere; 1.00007 International amperes (a); 1.00010 International amperes (v); 2.99796×10^{9} electrostatic cgs units or statamperes.

Electromagnetic cgs unit or abampere.—10.0000 amperes (absolute); 2.99796×10^{10} electrostatic cgs units or statamperes.

Electrostatic cgs unit or statampere.—3.33560×10^{-11} electromagnetic cgs unit or abampere; 3.33560×10^{-10} ampere (absolute).

Faraday per second.—9.6500×10^{4} ampere (absolute).

International ampere (a).—Based on the deposit of 0.00111800 grams of silver per second; 0.99993 ampere (absolute).

International ampere (v).—As defined by the International ohm and volt; 0.99990 ampere (absolute).

International ampere (U. S. before 1911).—0.99916 International ampere (v).

International ampere (England before 1906).—0.99870 International ampere (v).

International ampere (England 1906-8).—0.99894 International ampere (v).

International ampere (England 1909-10).—0.99990 International ampere (v).

International ampere (France before 1911).—0.9998 International ampere (v).

International ampere (Germany before 1911).—0.99968 International ampere (v).

Statampere.—*See* electrostatic cgs unit.

Electrical Field Strength $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{-\frac{1}{2}}t^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-2}]$

Electrostatic cgs unit of potential per centimeter.—299.796 volts per centimeter (absolute).

Electrostatic cgs unit of potential per inch.—118.05 volts per centimeter (absolute).

Electromagnetic cgs unit of potential per centimeter.—1.0000×10^{-8} volt per centimeter (absolute).

Electromagnetic cgs unit of potential per inch.—3.9370×10^{-9} volt per centimeter (absolute).

Volt per inch.—0.39370 volt per centimeter.

Potential $[\epsilon^{-\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{1}{2}}t^{-1}]$; $[\mu^{\frac{1}{2}}m^{\frac{1}{2}}l^{\frac{3}{2}}t^{-2}]$

Abvolt.—*See* electromagnetic cgs unit.

Electromagnetic cgs unit or abvolt.—3.33560×10^{-11} electrostatic cgs unit or statvolt; 1.0000×10^{-8} volt (absolute).

Electrostatic cgs unit or statvolt.—299.796 volts (absolute); 2.99796×10^{10} electromagnetic cgs units or abvolts.

International volt (a).—Based on the International ohm and ampere; 1.00045 volts (absolute).

International volt (v).—Based on the acceptance of the electromotive force of a Weston cell at 20 °C as 1.0183 International volts; 1.00042 volts (absolute).

International volt (U. S. before 1911).—0.99916 International volt (v).

International volt (England before 1906).—0.99870 International volt (v).

International volt (England 1906-8).—0.99894 International volt (v).

International volt (England 1909-10).—0.99990 International volt (v).

International volt (Germany and France, before 1911).—0.99968 International volt (v).

Statvolts.—*See* electrostatic cgs unit.

Volt (absolute).—0.0033356 electrostatic cgs unit or statvolts; 0.99955 International volt (a); 0.99958 International volt (v); 1×10^{8} electromagnetic cgs units or abvolts.

Resistance $[\epsilon^{-1}l^{-1}t]$; $[\mu l t^{-1}]$

Abohm.—*See* electromagnetic cgs unit.

Board of trade unit (England 1903).—0.9984 International ohm.

Electromagnetic cgs unit or abohm.—1.11263×10^{-21} electrostatic cgs unit or statohm; 1×10^{-15} megohm; 1.0000×10^{-9} ohm (absolute); 0.001 microhm.

Electrostatic cgs unit or statohm.—8.98776×10^{11} ohms (absolute); 8.98776×10^{20} electromagnetic cgs units or abohms.

International ohm.—The resistance of a uniform column of mercury at 0°C, 106.300 centimeters long, having a mass of 14.4521 grams; 1.00052 ohms (absolute); 1.0016 board of trade unit (England 1903); 1.0630 Siemens unit.

International ohm (France before 1911).—0.9999 International ohm.

"Legal ohm" of 1884 (England).—0.99718 International ohm.

Megohm.—1×10^{6} ohms.

Microhm.—1.11263×10^{-18} electrostatic cgs unit or statohm; 1×10^{-12} megohm; 1×10^{-6} ohm; 1000 electromagnetic cgs units or abohms.

Ohm (absolute).—1.11263×10^{-12} electrostatic cgs unit or statohm; 1×10^{-6} megohm (absolute); 0.99948 International ohm; 1×10^{6} microhms (absolute); 1×10^{9} electromagnetic cgs units or abohms.

Siemens unit.—0.94073 International ohm.

Statohm.—*See* electrostatic cgs unit.

Volume Resistivity $[\epsilon^{-1}t]$; $[\mu l^2 t^{-1}]$

Electromagnetic cgs unit (abohm)-centimeter.—9.9948×10^{-10} International ohm-centimeter; 0.001 microhm-centimeter; 0.0060153 ohm-mil*-foot.

Electrostatic cgs unit-centimeter.—8.98776×10^{11} International ohm-centimeters.

International annealed copper standard (20°C).—Volume resistivity of annealed copper; 1.7241 microhm-centimeters.

International ohm-centimeter.—1.00052 ohm-centimeters (absolute).

Microhm-centimeter.—1.0000×10^{-6} ohm-centimeter; 0.3937 microhm-inch; 6.0153 ohm-mil*-foot; 1000 abohm-centimeters.

---

*The unit thus marked refers to the diameter of a wire of circular cross section.

Microhm-inch.—2.5400 microhm-centimeters.

Ohm-centimeter (absolute).—0.99948 International ohm-centimeter; 1×10^6 microhm-centimeters.

Ohm-inch.—2.5400×10^6 microhm-centimeters.

Ohm-meter-millimeter².—100.0000 microhm-centimeters.

Ohm-meter-millimeter*.—78.540 microhm-centimeters.

Ohm-mil*-foot.—0.16624 microhm-centimeter; 166.24 electromagnetic cgs unit (abohm) centimeters.

Mass Resistivity $[\epsilon^{-1}ml^{-3}t]$; $[\mu ml^{-1}t^{-1}]$

Electromagnetic cgs unit.—9.9948×10^{-6} International ohm-meter-gram.

Electrostatic cgs unit.—8.9869×10^{15} International ohm-meter-gram.

International ohm-meter-gram.—1.00052 ohm (absolute)-meter-gram.

Ohm (absolute)-meter-gram.—0.99948 International ohm-meter-gram.

Ohm-centimeter-gram.—D† ohm-centimeter; 1.0000×10^4 ohm-meter-gram.

Ohm-mile-pound.—1.7513×10^{-4} ohm-meter-gram.

Volume Conductivity $[\epsilon t^{-1}]$; $[\mu^{-1}l^{-2}t]$

Electromagnetic cgs unit or abmhos per centimeter cube (ohm^{-1}-centimeter^{-1}).—166.2 mhos per mil* foot; 1000 megmhos per centimeter cube; 1.00052×10^9 International ohm^{-1}-centimeter^{-1}.

Electrostatic cgs unit.—1.11273×10^{-12} International ohm^{-1}-centimeter^{-1}.

International annealed copper standard (20°C).—0.5800 $microhm^{-1}$-centimeter^{-1}.

International ohm^{-1}-centimeter^{-1}.—0.99948 ohm^{-1}-centimeter^{-1} (absolute).

Megmhos per centimeter cube.—0.001 abmhos per centi-

†D represents the density in grams per centimeter cubed.

*The unit thus marked refers to the diameter of a wire of circular cross section.

meter cube; 0.1662 mhos per mil* foot; 2.540 megmhos per inch cube; 1 microhm^{-1}-centimeter^{-1}.

Megmhos per inch cube.—0.39370 megmhos per centimeter cube; 1 microhm^{-1}-inch^{-1}.

Mho centimeter cube.—1 ohm^{-1}-centimeter^{-1}.

Microhm^{-1}-centimeter^{-1}.—1.0000×10^{6} ohm^{-1}-centimeter^{-1}; 1 megmho per centimeter cube.

Microhm^{-1}-inch^{-1}.—0.39370 microhm^{-1}-centimeter^{-1}; 1 megmho per inch cube.

Ohm^{-1}-centimeter^{-1} (absolute).—1 mho per centimeter cube; 1.00052 International ohm^{-1}-centimeter^{-1}.

Ohm^{-1}-inch^{-1}.—3.9370×10^{-7} microhm^{-1}-centimeter^{-1}.

Ohm^{-1} (meter, millimeter*)$^{-1}$.—0.012732 microhm^{-1}-centimeter^{-1}.

Ohm^{-1} (meter, millimeter^{2})$^{-1}$.—0.01000 microhm^{-1}-centimeter^{-1}.

Ohm^{-1} (mil, foot)$^{-1}$.—6.0153 microhm^{-1}-centimeter^{-1}.

100% conductivity (20 °C).—0.5800 microhm^{-1}-centimeter^{-1}.

Mass Conductivity [$\epsilon m^{-1}l^{3}t^{-1}$]; [$\mu^{-1}m^{-1}lt$]

x **per electromagnetic cgs unit**$=1.00052\times10^{5}$ x per International ohm-meter-gram.

x **per electrostatic cgs unit**$=1.1127\times10^{-16}$ x per International ohm-meter-gram.

x **per International ohm-meter-gram**$=0.99948$ x per ohm (absolute)-meter-gram.

x **per ohm (absolute)-meter-gram**$=1.00052$ x per International ohm-meter-gram.

x **per ohm-centimeter-gram**$=1.0000\times10^{-4}$ x per ohm-meter-gram.

x **per ohm-mile-pound**$=0.0057100$ x per ohm-meter-gram.

Capacity [ϵl]; [$\mu^{-1}\, l^{-1}\, t^{2}$]

Electromagnetic cgs unit or abfarad.—1.0000×10^{9} farads (absolute); 1×10^{15} microfarads; 8.98776×10^{20} electrostatic cgs units or statfarads.

---

*The unit thus marked refers to the diameter of a wire of circular cross section.

Electrostatic cgs unit (statfarad or centimeter).—1.11263×10^{-21} electromagnetic cgs unit or abfarad; 1.11263×10^{-12} farad (absolute); 1.11263×10^{-6} microfarad.

Farad (absolute).—1×10^{-9} electromagnetic cgs unit or abfarad; 1.00052 International farad; 1×10^{6} microfarads; 8.98776×10^{11} electrostatic cgs units or statfarads.

International farad.—0.99948 farad (absolute).

Microfarad.—1×10^{-15} electromagnetic cgs unit or abfarad; 1×10^{-6} farad; 8.98776×10^{5} electrostatic cgs units or statfarads.

Micromicrofarad.—1×10^{-12} farad.

Statfarad.—*See* electrostatic cgs unit.

Inductance $[\epsilon^{-1} l^{-1} t^{2}]$; $[\mu l]$

Abhenry.—*See* electromagnetic cgs unit.

Electromagnetic cgs unit (abhenry or centimeter).—1.11263×10^{-21} electrostatic cgs unit or stathenry; 1.0000×10^{-9} henry (absolute); 1×10^{-6} millihenry.

Electrostatic cgs unit or stathenry.—8.98776×10^{11} henry (absolute); 8.98776×10^{14} millihenries; 8.98776×10^{20} abhenries.

Henry (absolute).—1.11263×10^{-12} electrostatic cgs unit or stathenry; 0.99948 International henry; 1000 millihenries; 1×10^{9} electromagnetic cgs units or abhenries.

International henry.—1.00052 henry (absolute).

Millihenry.—1.11263×10^{-15} stathenry; 0.001 henries; 1×10^{6} abhenries.

Stathenry.—*See* electrostatic cgs unit.

Thermoelectric Units

THERMOELECTRIC POWER $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}\ \theta^{-1}]$; $[\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{3}{2}}\ t^{-2}\ \theta^{-1}]$

Electromagnetic cgs unit of potential per °C.—0.010000 microvolt per °C (absolute).

Electromagnetic cgs unit of potential per °F.—0.018000 microvolt per °C (absolute).

Electrostatic cgs unit of potential per °C.—2.9986×10^{8} microvolt per °C (absolute).

Electrostatic cgs unit of potential per °F.—5.3975×10^{8} microvolt per °C (absolute).

Microvolt per °F.—1.8000 microvolt per °C.

PELTIER COEFFICIENT $[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-1}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{3}{2}}\, t^{-2}]$

Calorie (15 °C) per ampere-hour.—0.011625 joule per electromagnetic unit quantity.

Calorie (15 °C) per coulomb.—41.850 joules per electromagnetic unit quantity.

Joule per ampere-hour (absolute).—9.2636×10^{-14} joule per electrostatic unit quantity; 0.0027778 joule per electromagnetic unit quantity.

Joule per coulomb.—10.000 joules per electromagnetic unit quantity.

Joule per electron.—6.2811×10^{19} joules per electromagnetic unit quantity.

Joule per faraday.—1.0363×10^{-4} joule per electromagnetic unit quantity.

COEFFICIENT OF THOMSON EFFECT

$[\epsilon^{-\frac{1}{2}}\, m^{\frac{1}{2}}\, l^{\frac{1}{2}}\, t^{-1}\ \theta^{-1}]$; $[\mu^{\frac{1}{2}}\, m^{\frac{1}{2}}\, t^{-2}\ \theta^{-1}]$

Joule per coulomb per °F.—1.8000 joules per coulomb per °C.

Joule per electromagnetic unit quantity per °F.—0.1800 joule per coulomb per °C.

Joule per electron per °C.—6.2811×10^{18} joules per coulomb per °C.

Joule per electrostatic unit quantity per °C.—2.9986×10^{9} joules per coulomb per °C.

Joule per electrostatic unit quantity per °F.—5.3975×10^{9} joules per coulomb per °C.

Joule per faraday per °C.—1.0363×10^{-5} joule per coulomb per °C.

Volt per °C.—1.0000 joule per coulomb per °C.

Piezoelectric Constant $[\epsilon^{\frac{1}{2}} m^{-\frac{1}{2}} l^{\frac{1}{2}} t]$; $[\mu^{-\frac{1}{2}} m^{-\frac{1}{2}} l^{-\frac{1}{2}} t^{2}]$

Coulomb per kilogram weight.—3057.7 electrostatic unit quantity per dyne.

Electromagnetic unit quantity per kilogram weight.—3.0577×10^{4} electrostatic unit quantity per dyne.

Electromagnetic unit quantity per pound weight—6.7411×10^{4} electrostatic unit quantity per dyne.

Electron per kilogram weight.— 4.868×10^{-16} electrostatic unit quantity per dyne.

Electrostatic unit quantity per kilogram weight.—1.0197×10^{-6} electrostatic unit quantity per dyne.

Electrostatic unit quantity per pound weight.—2.2481×10^{-6} electrostatic unit quantity per dyne.

Faraday per kilogram weight.— 2.9507×10^{8} electrostatic unit quantity per dyne.

Flux of Magnetic Induction; Magnetic Flux; Pole Strength

$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{3}{2}} t^{-1}]$

Electromagnetic cgs unit (unit pole).—4π maxwell (absolute).

Electrostatic cgs unit.—2.99796×10^{10} maxwells (absolute).

International maxwell (a).—1.00045 maxwells (absolute).

International maxwell (v).—1.00042 maxwells (absolute).

Kilolines.—1000 maxwells.

Line.—1.0000 maxwell (absolute).

Maxwell (absolute).—3.3356×10^{-11} electrostatic cgs unit; 0.99955 International maxwell (a); 0.99958 International maxwell (v); 1.0000 line.

Megaline.—1×10^{6} maxwells.

Volt-second.—1×10^{8} maxwells.

Weber.—1 volt-second; 1×10^{8} maxwells.

Magnetic Field Intensity $[\epsilon^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2}]$; $[\mu^{-\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$

Ampere-turn per centimeter.—1.2566 gauss.

Ampere-turn per inch.—0.49474 gauss.

Electromagnetic cgs unit.—1.0000 gauss (absolute).

Electrostatic cgs unit.—3.33560×10^{-11} gauss (absolute).

Gamma (γ).—1.0000×10^{-5} gauss.

Gauss (absolute).—0.79580 ampere-turn per centimeter; 1 electromagnetic cgs unit; 1 gilbert per centimeter; 1.00007 International gauss (a); 1.00010 International gauss (v); 2.0213 ampere-turns per inch; 6.452 lines per square inch; 1×10^{5} gamma (γ); 2.99796×10^{10} electrostatic cgs units.

Gilbert per centimeter.—1.0000 gauss; 2.021 ampere-turns per inch.

International gauss (a).—0.99993 gauss (absolute).

International gauss (v).—0.99990 gauss (absolute).

Lines per square centimeter.—1 gauss.

Lines per square inch.—0.1550 gauss.

Magnetomotive Force; Magnetic Potential

$[\epsilon^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{3}{2}} t^{-2}]$; $[\mu^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$

Abampere-turn.—10 ampere-turns; 12.566 gilberts.

Ampere-turn.—0.1 abampere-turn; 1.2566 gilberts.

Electromagnetic cgs unit.—1.00000 gilbert (absolute).

Electrostatic cgs unit.—3.33560×10^{-11} gilbert (absolute).

Gilbert (absolute).—0.07958 abampere-turn; 0.7958 ampere-turn; 1.00007 International gilbert (a); 1.00010 International gilbert (v).

International gilbert (a).—0.99993 gilbert (absolute).

International gilbert (v).—0.99990 gilbert (absolute).

Reluctance $[\epsilon\, l\, t^{-2}]$; $[\mu^{-1} l^{-1}]$

Electromagnetic cgs unit.—1.0000 oersted (absolute).

Electrostatic cgs unit.—1.1122×10^{-21} oërsted (absolute).

International oersted.—0.99948 oersted (absolute).

Oersted (absolute).—1.00052 International oersted.

Magnetic Induction; Intensity of Magnetization

$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{3}{2}}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$

Electromagnetic cgs unit.—1.00000 maxwell (absolute) per square centimeter.

Electrostatic cgs unit.—2.9986×10^{10} maxwells (absolute) per square centimeter.

International maxwell per square centimeter (a).—1.00045 maxwells (absolute) per square centimeter.

International maxwell per square centimeter (v).—1.00042 maxwells (absolute) per square centimeter.

Line per square centimeter.—1.00000 maxwell per square centimeter.

Line per square inch.—0.15500 maxwell per square centimeter.

Maxwell per square centimeter (**absolute**).—0.99955 International maxwell per square centimeter (a); 0.99958 International maxwell per square centimeter (v).

Maxwell per square inch.—0.15500 maxwell per square centimeter.

Dielectric Constant; Electrical Inductivity; Magnetic Permeability; Susceptibility.

Electromagnetic cgs unit.—8.9916×10^{20} electrostatic cgs units.

Foot-pound-second electromagnetic unit.—0.0010764 electromagnetic cgs unit; 9.6784×10^{17} electrostatic cgs units.

Foot-pound-second-electrostatic unit.—1.0000 electrostatic cgs unit.

Magnetic Effects

COEFFICIENT OF LEDUC EFFECT $[\epsilon^{-\frac{1}{2}}\, m^{-\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^2]$; $[\mu^{\frac{1}{2}}\, m^{-\frac{1}{2}}\, l^{\frac{1}{2}}\, t]$

x centimeters per **ampere-turn** = 0.79577 x per gauss.

x centimeters per **gilbert** = 1.0000 x per gauss.

x per **electrostatic cgs unit** = 2.9986×10^{10} x per gauss.

x inches per **ampere-turn** = 2.0213 x per gauss.

COEFFICIENT OF HALL EFFECT $[\epsilon^{-\frac{1}{2}}\, m^{-\frac{1}{2}}\, l^{-\frac{1}{2}}\, t^3]$; $[\mu^{\frac{1}{2}}\, m^{-\frac{1}{2}}\, l^{\frac{5}{2}}]$

Electrostatic cgs unit.—2.6962×10^{31} electromagnetic cgs unit.

Volt centimeter per ampere gauss (**absolute**).—1.0000×10^{9} electromagnetic cgs unit.

Volt inch per ampere gauss (**absolute**).—2.5400×10^{9} electromagnetic cgs unit.

COEFFICIENT OF ETTINGHAUSEN EFFECT

$[\epsilon^{-1}\, m^{-1}\, l^{-1}\, t^4\, \theta]$; $[\mu m^{-1}\, l t^2\, \theta]$

°C centimeter per ampere gauss (**absolute**).—10.000 °C centimeter per electromagnetic cgs unit.

°C centimeter per electrostatic cgs unit.—8.9916×10^{20} °C centimeter per electromagnetic cgs unit.

°F inch per ampere gauss (absolute).—45.720 °C centimeter per electromagnetic cgs unit.

COEFFICIENT OF NERNST EFFECT $[\epsilon^{-1} t\, \theta^{-1}]$; $[\mu l^2 t^{-1} \theta^{-1}]$

Electrostatic cgs unit per °C.—8.9916×10^{20} electromagnetic cgs unit per °C.

Volt per gauss °C (absolute).—1.0000×10^8 electromagnetic cgs unit per °C.

Volt per gauss °F (absolute).—1.8000×10^8 electromagnetic cgs unit per °C.

VERDET'S CONSTANT $[\epsilon^{-\frac{1}{2}} m^{-\frac{1}{2}} l^{-\frac{1}{2}} t^2]$; $[\mu^{\frac{1}{2}} m^{-\frac{1}{2}} l^{-\frac{1}{2}} t]$

Minute per ampere-turn.—1.2566 minute per electromagnetic cgs unit.

Minute per gilbert.—1.0000 minute per electromagnetic cgs unit.

Radian per gilbert.—3437.7 minute per electromagnetic cgs unit.

RELATIONS OF ELECTRICAL UNITS

1 ohm	$=10^9$ electromagnetic	$=1/9 \times 10^{-11}$ electrostatic
1 volt	$=10^8$ electromagnetic	$=1/3 \times 10^{-2}$ electrostatic
1 ampere	$=10^{-1}$ electromagnetic	$= 3 \times 10^9$ electrostatic
1 coulomb	$=10^{-1}$ electromagnetic	$= 3 \times 10^9$ electrostatic
1 farad	$=10^{-9}$ electromagnetic	$= 9 \times 10^{11}$ electrostatic
1 farad	=1,000,000 microfarads	
1 henry	$=10^9$ electromagnetic	$=1/9 \times 10^{-11}$ electrostatic

VALUE OF THE GAS CONSTANT R FOR VARIOUS UNITS

8.3136×10^7 ergs per °C per mole.
1.9864 calories per °C per mole.

Units of pressure	Units of volume.	R per gram molecule.
Atmospheres	Volume at 0° C.	0.003662
Atmospheres	cm^3	82.07
Atmospheres	liters	0.08207
Atmospheres	cubic meters	
Dynes per cm^2 [barye]	cm^3	8.3156×10^7
Kilograms per m^2 [g = 980.6]	cm^3	8.48×10^5
		R per lb. molecule.
Pounds per sq.in.	cu.in.	18510.
Pounds per sq.in.	cu.ft.	10.71
Atmospheres	cu.in.	1260.
Atmospheres	cu.ft.	0.729

FACTORS FOR CONVERSION OF ENERGY UNITS

(From Perkins' Introduction to General Thermodynamics, John Wiley & Sons, publishers, by permission.)

	Gram-calories (4° C)	B.T.U.*	Joules	Foot-pounds	Kilogr.-meters	Liter-atmos.	Cu.ft.-atmos.	Foot-poundals	Horse-power hours

LENGTHS — CENTIMETERS TO INCHES

0.1 *to* 100 *Units*

1 centimeter = 0.393700 inches

The values found in the body of the table give, in inches, the lengths indicated in centimeters at the top and side.

LENGTHS — INCHES TO CENTIMETERS

From 0.1 *to* 100 *Units*

1 inch = 2.54001 centimeters

The values found in the body of the table give, in centimeters, the lengths indicated in inches at the top and side.

LENGTHS — METERS TO FEET

From 1 *to* 1,000 *Units*

Reduction factor: 1 meter = 3.280833333 feet

The values found in the body of the table give, in feet, the length indicated in meters at the top and side.

LENGTHS — FEET TO METERS

From 1 *to* 1,000 *Units*

Reduction factor: 1 foot = 0.3048006096 meter

The values found in the body of the table give, in meters, the lengths indicated in feet at the top and side.

LENGTHS — KILOMETERS TO MILES

From 1 *to* 1,000 *Units*

Reduction factor: 1 kilometer = 0.6213699495 mile

Values found in the body of the table give, in miles, the length indicated in kilometers at the top and side.

CAPACITIES—LITERS TO LIQUID QUARTS

From 1 *to* 1,000 *Units*

Reduction factor: 1 liter = 1.056710 liquid quarts (U. S.)

The values found in the body of the table give, in liquid quarts, the capacities indicated in liters at the top and side.

WEIGHTS — KILOGRAMS TO AVOIRDUPOIS POUNDS

From 1 to 1,000 Units

Reduction factor: 1 kilogram = 2.204622341 avoirdupois pounds

The values found in the body of the table give, in avoirdupois pounds, the weights indicated in kilograms at the top and side.

TO CONVERT DEGREES FAHRENHEIT TO DEGREES CENTIGRADE

Use the first table for one of the digits, and the second table for the others; then add.

Examples: To find the Centigrade equivalent for 35.F.

$$\begin{array}{rcll} 30 & = & 16.67 & (2) \\ \underline{5} & = & \underline{-15} & (1) \\ \underline{\underline{35}}.F & = & \underline{\underline{1.67}}.C & \end{array} \quad \text{or,} \quad \begin{array}{rcll} 30 & = & -1.11 & (1) \\ \underline{5} & = & \underline{2.78} & (2) \\ \underline{\underline{35}}.F & = & \underline{\underline{1.67}}.C & \end{array}$$

To find the C. equivalent for 355.F. and 5445.F.

To Convert Degrees Centigrade to Degrees Fahrenheit

Use the first table for one digit, and the second table for the others; then add.

Examples: To find the Fahrenheit equivalents for 15.C.; 155.C.; and 5432.C.

10	= 50(1)		18(2)	
5	= 9(2)	or,	41(1)	
15.C.	= 59.F.		59.F.	

100	= 212(1)		= 180(2)
50	= 90(2)	or,	= 90(2)
5	= 9(2)		41(1)
155.C.	= 311.F		= 311.F.

5000	= 9000(2)		= 9000(2)
400	= 720(2)	or,	= 752(1)
30	= 54(2)		= 54(2)
2	= 35.6(1)		= 3.6(2)
5432.C.	= 9809.6.F.		= 9809.6.F.

THERMOMETER SCALES

Corrections to Reduce Gas Thermometer Temperature to Thermodynamic Scale.

The values below are corrections to be applied to temperatures determined by the gas thermometer indicated to give temperatures in the thermodynamic centigrade scale for an initial pressure of 100 cm.

Temp. °C	Corrections in °C					
	Constant Volume			Constant Pressure		
	Hydrogen	Nitrogen	Helium	Hydrogen	Nitrogen	Helium

MOMENT OF INERTIA FOR VARIOUS BODIES

The mass of the body is indicated by m.

Body	Axis	Moment of inertia
Uniform thin rod	Normal to the length, at one end	$m\frac{l^2}{3}$
Uniform thin rod	Normal to the length, at the center	$m\frac{l^2}{12}$
Thin rectangular sheet, sides a and b	Through the center parallel to b	$m\frac{a^2}{12}$
Thin rectangular sheet, sides a and b	Through the center perpendicular to the sheet	$m\frac{a^2+b^2}{12}$
Thin circular sheet of radius r	Normal to the plate through the center	$m\frac{r^2}{2}$
Thin circular sheet of radius r	Along any diameter	$m\frac{r^2}{4}$
Thin circular ring. Plane figure formed by two concentric circles of radius r_1 and r_2	Through center normal to plane of ring	$m\frac{r_1^2+r_2^2}{2}$
Thin circular ring. Plane figure formed by two concentric circles of radius, r_1 and r_2	Any diameter	$m\frac{r_1^2+r_2^2}{4}$
Rectangular parallelopiped, edges a, b, and c	Through center perpendicular to face ab, (parallel to edge c)	$m\frac{a^2+b^2}{12}$
Sphere, radius r	Any diameter	$m\frac{2}{5}r^2$
Spherical shell, external radius, r_1 internal, radius r_2	Any diameter	$m\frac{2}{5}\frac{(r_1^5-r_2^5)}{(r_1^3-r_2^3)}$

MOMENT OF INERTIA FOR VARIOUS BODIES (Continued)

The mass of the body is indicated by m.

Body	Axis	Moment of inertia
Spherical shell, very thin, mean radius, r	Any diameter	$m\frac{2r^2}{3}$
Right circular cylinder of radius r, length l	The longitudinal axis of the solid	$m\frac{r^2}{2}$
Right circular cylinder of radius r, length l	Through center perpendicular to the axis of the figure, (transverse diameter)	$m\left(\frac{r^2}{4}+\frac{l^2}{12}\right)$
Hollow circular cylinder, length l, external radius r_1 internal radius r_2	The longitudinal axis of the figure	$m\frac{(r_1^2+r_2^2)}{2}$
Thin cylindrical shell, length l, mean radius, r	The longitudinal axis of the figure	mr^2
Hollow circular cylinder, length l, external radius r_1, internal radius r_2	Transverse diameter	$m\left[\frac{r_1^2+r_2^2}{4}+\frac{l^2}{12}\right]$
Hollow circular cylinder, length l, very thin, mean radius r	Transverse diameter	$m\left(\frac{r^2}{2}+\frac{l^2}{12}\right)$
Elliptic cylinder, length l, transverse semiaxes a and b	Longitudinal axis	$m\left(\frac{a^2+b^2}{4}\right)$
Right cone, altitude h, radius of base r	Axis of the figure	$m\frac{3}{10}r^2$
Spheroid of revolution, equatorial radius r	Polar axis	$m\frac{2r^2}{5}$
Ellipsoid, axes $2a$, $2b$, $2c$	Axis $2a$	$m\frac{(b^2+c^2)}{5}$

RADIO FORMULÆ

A collection of formulae useful in the computation of inductance, capacity, and other constants of oscillating circuits. From Radio Instruments and Measurements, Bureau of Standards.

CAPACITY

Units. — In the following formulæ all lengths are expressed in centimeters, areas in square centimeters; the dielectric constant K, is taken as unity for air. Capacities will be given in micromicrofarads = 10^{-12} farads. The electrostatic unit of capacity, sometimes called the centimeter = 1.1124 micromicrofarads.

Parallel plate condenser. — If s be the area of one plate; t, the thickness of the dielectric; K, the dielectric constant; and N, the number of plates, — the capacity

$$C = 0.0885\, K \frac{(N-1)s}{t}.$$

Variable condenser, semicircular plates. — Where N is the total number of parallel plates; r_1 the outer, and r_2 the inner radius of the plates; t, the thickness of the dielectric, and K the dielectric constant, — the maximum capacity is given by

$$C = 0.1390K \frac{(N-1)(r_1^2 - r_2^2)}{t}.$$

Isolated thin circular disk. — If d is the diameter of the disk

$$C = 0.354d.$$

Isolated sphere. — If d is the diameter of the sphere

$$C = 0.556d.$$

Two concentric spheres. — If r_1 is the radius of the outer sphere; r_2, that of the inner sphere; K, the dielectric constant of the material between the spheres,

$$C = 1.112K \frac{r_1 r_2}{r_1 - r_2}.$$

Two coaxial cylinders. — If r_1 is the radius of the outer cylinder; r_2, that of the inner; l, the length of the cylinders; K, the dielectric constant,

$$C = K \frac{0.2416\, l}{\log_{10} \frac{r_1}{r_2}}.$$

Single long wire parallel to the ground. — For a wire of length l; diameter, d; suspended at a height h above the ground, where the diameter is small compared with the length,

For $\frac{4h}{l} = \text{or} < 1$ $\quad C = \dfrac{0.2416\ l}{\log_{10}\frac{4h}{d} - k_1}$

For $\frac{l}{4h} = \text{or} < 1$ $\quad C = \dfrac{0.2416\ l}{\log_{10}\frac{2\,l}{d} - k_2}$

In which,

$$k_1 = \log_{10}\left[\frac{1+\sqrt{1+\left(\frac{4h}{l}\right)^2}}{2}\right] \qquad k_2 = \log_{10}\left[\frac{l}{4h}+\sqrt{1+\left(\frac{l}{4h}\right)^2}\right]$$

the values of which may be found in a table at the end of this section.

Vertical wire. — For a wire of length l, relatively high above the ground; of diameter d, the approximate capacity is as follows,

$$C = \frac{0.2416\,l}{\log_{10}\frac{2l}{d}}.$$

Two horizontal parallel wires at the same height. — If d is the diameter of each wire; l, the length of each; h, the height above the ground; D, the distance between wires, — where d and D are small compared to l,

$$C = \frac{0.1208\,l}{\log_{10}\frac{2D}{d} - \frac{D^2}{8h^2}}.$$

Two parallel horizontal wires, one above the other. — Use the preceding formula for parallel wires at the same height, substituting the mean height for h.

Two parallel wires joined together, both at the same height. — Let l be the length of each wire; D, the distance between centers; h, the height above the ground; d_2 the diameter of cross section of the wire. If d^2 and D^2 are small compared with l^2 and $4h^2$ respectively

For $\frac{4h}{l} = \text{or} < 1$ $\quad C = \dfrac{0.4831\,l}{\log_{10}\frac{4h}{d} + \log_{10}\frac{2h}{D} - 2k_1}.$

For $\frac{l}{4h} = \text{or} < 1$ $\quad C = \dfrac{0.4831\,l}{\log_{10}\frac{2l}{d} + \log_{10}\frac{l}{D} - 2k_2}.$

k_1 and k_2 have the same significance as above and may be found from the tables at the end of the section.

Several wires in parallel. — If n parallel wires are joined together; D, the spacing between the wires; d, the diameter of the wire; h, the height above the ground; l, the length of the group, -- the approximate capacity is,

$$C = \frac{1.112\, l}{\frac{p_{11} + (n-1)p_{12}}{n} - k}.$$

p_{11} and p_{12} may be computed from the following:

For $\frac{4h}{l}$ = or < 1

$$p_{11} = 4.605\left[\log_{10}\frac{4h}{d} - k_1\right]$$

$$p_{12} = 4.605\left[\log_{10}\frac{2h}{D} - k_1\right]$$

For $\frac{l}{4h}$ = or < 1

$$p_{11} = 4.605\left[\log_{10}\frac{2l}{d} - k_2\right]$$

$$p_{12} = 4.605\left[\log_{10}\frac{l}{D} - k_2\right]$$

Values of k, k_1, k_2 may be found in the following table.

TABLE 1

$\frac{4h}{l}$	k_1	$\frac{l}{4h}$	k_2	n	k	n	k

INDUCTANCE

Units. — In the following formulæ all lengths are expressed in centimeters. The inductance calculated will be in micro-henries = 10^{-6} henry.

Long straight round wire. — If l is the length; d, the diameter of cross section; μ the permeability of the material, — the inductance at zero or low frequency is,

$$L = 0.002\, l\left[2.303 \log_{10}\frac{4l}{d} - 1 + \frac{\mu}{4}\right]$$

For all except iron wire $\mu = 1$ and the last term becomes 0.25.

For wires whose length is less than about 1000 times the diameter the term $+\frac{d}{2l}$ should be added inside the brackets.

For any frequency:

$$L = 0.002\,l\left[2.303 \log_{10}\frac{4l}{d} - 1 + \mu\delta\right]$$

where δ is a quantity given in Table 2 below as a function of x. x is to be computed from the relation

$$x = 0.1405d\sqrt{\frac{\mu f}{\rho}}$$

where d and μ are as above; f, the frequency and ρ the resistivity of the material of the wire expressed in microhm-centimeters. (See Properties of Metallic Conductors.)

For copper at 20° C.

$$x = 0.1071\,d\sqrt{f}.$$

For wires other than iron, whose length is 100,000 times the diameter the inductance at infinite frequency is about 2% less than at zero frequency.

TABLE 2

Values of δ for computing inductance at any frequency.

x	δ	x	δ
0	0.250	12	0.059
0.5	.250	14	.050
1.0	.249	16	.044
1.5	.247	18	.039

7.0	.100	90	.008
8.0	.088	100	.007
9.0	.078	∞	.000
10.0	.070		

Two parallel round wires, return circuit.—If l is the length of each wire; d, the diameter; D, the distance between centers of wires; μ the permeability,—the inductance for any frequency is

$$L=0.004\,l\left[2.303\,\log_{10}\frac{2D}{d}-\frac{D}{l}+\mu\delta\right]$$

where δ is a quantity to be obtained from the table above as a function of x which is to be computed as explained for the previous formula.

For copper and at low frequency the term δ becomes 0.25.

. **Square of round wire.**—If a is the length of the side of the square; d, the diameter of the wire; μ the permeability, the inductance for any frequency is,

$$L=0.008a\left[2.303\,\log_{10}\frac{2a}{d}+\frac{d}{2a}-0.774+\mu\delta\right]$$

where δ is obtained as above. For low frequency and for wires other than iron δ becomes 0.25; for infinite frequency the value is zero.

Grounded horizontal wire, the Earth acting as return circuit. If l is the length of wire; h, the height above the ground; l, the diameter of the wire; μ the permeability and δ the frequency constant (see table 2), the inductance,—where d is small compared with l,—is given as follows:

For $\frac{2h}{l}$ = or <1 $\qquad L=0.002\,l\left[2.3026\,\log_{10}\frac{4h}{d}-P+\mu\delta\right]$

For $\frac{l}{2h}$ = or <1 $\qquad L=0.002\,l\left[2.3026\,\log_{10}\frac{4\,l}{d}-Q+\mu\delta\right]$

P and Q may be found in the following table.

TABLE 3

$\frac{2h}{l}$	P	$\frac{l}{2h}$	Q	$\frac{2h}{l}$	P	$\frac{l}{2h}$	Q
0	0	0	1.0000	0.6	0.5136	0.6	1.2918
0.1	0.0975	0.1	1.0499	.7	.5840	.7	1.3373
.2	.1900	.2	1.0997	.8	.6507	.8	1.3819
.3	.2778	.3	1.1489	.9	.7139	.9	1.4251
.4	.3608	.4	1.1975	1.0	.7740	1.0	1.4672
.5	.4393	.5	1.2452	.....	....	.....	....

The mutual inductance of the case above may be expressed

For $\frac{2h}{l}$ = or <1 $M = 0.002\, l\left[2.3026 \log_{10} \frac{2h}{D} - P + \frac{D}{l}\right]$

For $\frac{l}{2h}$ = or <1 $M = 0.002\, l\left[2.3026 \log_{10} \frac{2l}{D} - Q + \frac{D}{l}\right]$

The values of P and Q are found in the table above.

Grounded wires in parallel. — Compute by the above formulae the inductance L_1 per unit length of a single wire and the mutual inductance M_1 per unit length of two adjacent wires, using the actual length in determining the ratios $\frac{2h}{l}$, $\frac{2l}{d}$ etc. Then the inductance of n parallel wires will be,

$$L = l\left[\frac{L_1 + (n-1)M_1}{n} - 0.001k\right]$$

where k is a function of n found in Table 1 under capacity formulae.

Circular ring of round wire. — If a is the mean radius of the ring; d, the diameter of the wire, the inductance at any frequency is

$$L = 0.01257a\left[2.303 \log_{10} \frac{16a}{d} - 2 + \mu\delta\right]$$

where δ is determined from the table above.

Circular coil of circular cross section. — For a coil of n fine wires wound with mean radius of the turns a, the cross section of whose winding is a circle of diameter d, the inductance at low frequency, for wire other than iron, neglecting insulation space is,

$$L = 0.01257an^2\left[2.303 \log_{10} \frac{16a}{d} - 1.75\right]$$

Torus with a single layer transverse winding, — a circular solenoid of circular cross section. If r is the distance from the center of the torus to the center of the transverse section; a, the radius of the turns of the winding; n, the number of turns the inductance at low frequency is

$$L = 0.01257n^2\left[r - \sqrt{r^2 - a^2}\right]$$

Solenoid, single layer. If n is the number of turns; a the radius of the coil; b, the length, the approximate inductance at any frequency is,

$$L = \frac{0.03948a^2n^2}{b}K$$

where K is a function of $\frac{2a}{b}$ given in the table below.

TABLE 4

$\frac{2a}{b}$	K	$\frac{2a}{b}$	K	$\frac{2a}{b}$	K

Long multiple layer solenoid. — The inductance is given approximately by,

$$L = L_1 - \frac{0.01257n^2ac}{b}(0.693 + B_s)$$

where L_1 is the inductance calculated from the formula for a single layer solenoid, n being the number of turns of the winding; a, the radius of the coil measured from the axis to the center of the cross section of the winding; b, the length of the coil; c, the radial depth of the winding; B_s a correction given in table below as a function of b/c.

TABLE 5

Square coil of rectangular cross section. — If a be the side of the square measured to the center of the rectangular section which has sides b and c and if n be the number of turns,

$$L = 0.008an^2\left[2.303 \log_{10} \frac{a}{b+c} + 0.2235 \frac{b+c}{a} + 0.726\right]$$

If the cross section is a square $b = c$ and the expression becomes

$$L = 0.008an^2\left[2.303 \log_{10} \frac{a}{b} + 0.447 \frac{b}{a} + 0.033\right]$$

Mutual Inductance

Two parallel wires. — If l be the length of each wire; D, the distance between, the inductance is

$$M = 0.002\,l\left[2.303 \log_{10} \frac{2l}{D} - 1 + \frac{D}{l}\right]$$

Coaxial solenoids, single layer coils, not concentric. If a is the radius of the smaller coil; A, the radius of the larger: n_1 and n_2 the number of turns on the smaller and larger coil respectively; $2l$ the length of the smaller coil; $2x$, the length of

the larger; D, the distance between the centers of the coils measured along the common axis,

$$M = 0.009870\frac{a^2A^2n_1n_2}{2x.2\,l}\left[K_1k_1 + K_3k_3 + K_5k_5\right]$$

where

$$K_1 = \frac{2}{A^2}\left(\frac{x_2}{r_2} - \frac{x_1}{r_1}\right) \qquad k_1 = 2\,l$$

$$K_3 = \frac{1}{2}\left(\frac{x_1}{r_1^5} - \frac{x_2}{r_2^5}\right) \qquad k_3 = a^2\,l\left(3 - 4\frac{l^2}{a^2}\right)$$

$$K_5 = -\frac{A^2}{8}\left[\frac{x_1}{r_1^9}\left(3 - 4\frac{x_1^2}{A^2}\right) - \frac{x_2}{r_2^9}\left(3 - 4\frac{x_2^2}{A^2}\right)\right]$$

$$k_5 = a^4\,l\left(\frac{5}{2} - 10\frac{l^2}{a^2} + 4\frac{l^4}{a^4}\right)$$

where

$$x_1 = D - x \qquad r_1 = \sqrt{x_1^2 + A^2}$$

$$x_2 = D + x \qquad r_2 = \sqrt{x_2^2 + A^2}$$

The above is most accurate for short coils with relatively great distance between.

Coaxial, concentric solenoids, outer coil the longer. If a be the radius of the smaller coil; A, that of the larger; $2l$, the length of the inner coil; $2x$, the length of the outer; n_1 and n_2 the number of turns on the inner and outer coil respectively,

$$M = \frac{0.01974a^2n_1n_2}{g}\left[1 + \frac{A^2a^2}{8g^4}\left(3 - 4\frac{l^2}{a^2}\right)\right]$$

where $g = \sqrt{x^2 + A^2}$.

Coaxial, concentric solenoids, outer coil the shorter. Assuming the symbols as before except

$$g = \sqrt{l^2 + A^2}$$

$$M = 0.01974\frac{a^2n_1n_2}{g}\left[1 + \frac{A^2a^2}{8g^4}\left(3 - 4\frac{x^2}{a^2}\right)\right]$$

High Frequency Resistance

Cylindrical straight wires.—The ratio R/R_0 of the high frequency resistance to the resistance at low frequency may be found from the table below, by calculating first the value of x from the relation,

$$x = \pi d\sqrt{\frac{2\mu f}{\rho}}\sqrt{\frac{1}{1000}}$$

where d is the diameter of the wire in centimeters; μ, the magnetic permeability; f, the frequency; ρ, the resistivity in microhm-centimeters.

For copper wire $x = 10da$ where a has a value given by $a = 0.01071$ The value of a for various frequencies may be found in the second of the two tables below. The above method gives the high-frequency resistance of simple circuits of any shape where the length is great compared with the diameter of the wire and the different portions of the circuit are not close to each other.

TABLE 6

Ratio of High-Frequency Resistance to the Direct-Current Resistance.

As an extension of the above table the following relation may be used:

$$R/R_o = x/2.828 + 0.25.$$

The equation is valid for values of x greater than 7 at which point the error is about 1 % and decreasing with increasing values of x.

Wave Length

The wave length in meters is given by the following expression when L, the inductance, is in microhenries and C, the capacity, is in microfarads. The resistance is assumed negligible.

$$\lambda = 1884\sqrt{LC}$$

VALUES OF "L C"

The following table gives values of the product of the inductance and capacity (L C) in microhenries and microfarads for wave lengths from 1 to 20,000 meters, and the corresponding frequencies in kilocycles.

Wave length, meters	Frequency, kilocycles	L C Microhenries Microfarads	Wave length, meters	Frequency, kilocycles	L C Microhenries Microfarads

CHARACTERISTICS OF

Compiled by

RECEIVING

The following table gives the average characteristics of various receiving tubes designated by number. The last two figures only are required to identify the tube. For example; tube 301-A or 201-A will appear in the table as 01-A.

Type No.	Purpose	Base	Cathode			Plate voltage	Plate current, ma
			Type	Voltage	Current, amp.		
00-A	Detector	4-1	Fil.	5.0	0.25	45	1.5
01-A	Gen. purpose	4-1	Fil.	5.0	0.25	90	2.5

LABORATORY ARTS AND RECIPES

Many of the following recipes have been contributed by users of the Handbook. To those who have cooperated in this way we extend our grateful acknowledgment.

BLUING STEEL AND IRON

The metal is cleaned with a potassium bichromate-sulfuric acid mixture, then washed with ammonium hydroxide and rubbed dry. Apply ammonium polysulfide until the desired depth of color is obtained, allowing the object to dry after each application and rubbing briskly with soft clean cloth. The result is a deep blue which may be made very nearly black by repeated applications. Rubbing with boiled linseed oil will deepen this color more. The finish thus obtained is very resistant to oxidation.

CEMENTS AND ADHESIVES

Acid Proof Cement

1

A handy acid resisting cement can be made by mixing sodium silicate and asbestos powder to the consistency of a thin paste. If allowed to dry for a day, the resulting cement will resist the strongest acids.

2

Barium sulfate 4 parts, water glass 3 parts, asbestos 1 part. Sodium fluosilicate or sodium fluoroborate is advised in addition when the cement is used on glass.

Aquarium Cement

1

Glazier's putty	10 lb.
Litharge	1 lb.
Red lead	1 lb.
Asphaltum	4 oz. fl.

Mix with boiled linseed oil to the proper consistency. Lamp black may be added to give a gray color.

2

Red lead	3 parts
Litharge	7 parts
Fine sand	10 parts
Powdered rosin	1 part

Add sufficient spar varnish to give the proper consistency.

Cement for Cellophane

The following is said to be a very satisfactory glue or cement for cellophane:

Gum acacia (gum arabic)	16.5 parts by weight
Glycerin	29.5 parts by weight
Water	49.5 parts by weight
Formaldehyde (40 %)	4.5 parts by weight

Cupric Oxide Cement

For a strong adhesive cement for attaching metal articles to each other or for cementing glass, a paste of cupric oxide and phosphoric acid is very satisfactory. The cement is adhesive, strong and sets quite rapidly.

De Khotinsky Cement

1

About 70 grams of light brown orange shellac is added in small amounts to 30 grams of heated pine tar. The mixture is stirred at frequent intervals for a period of two hours (or four hours) and maintained at a temperature of 130° C. or slightly lower. (The longer heating period gives a cement that is suitable for high vacuum work.) The product may be tested at intervals by dropping some of it into cold water and then subjecting it to bending pressure. Under such treatment, the product should not bend but break with a conchoidal fracture.

If a harder product is desired, 85 grams of light brown shellac may be mixed and heated with 30 grams of pine tar.

The finished product, while still warm, may be spread on a stone slab or a smooth surface and rolled into small sticks.

This sealing cement will be found useful whenever two pieces of apparatus are to be cemented together. The cementing is effected by warming the surfaces and applying melted cement. The removal of the cement may be facilitated by softening it with alcohol.

2

A handy water-proof laboratory cement of the type "Kotinsky Cement" is made from:

Dry yellow or orange shellac	3 parts by weight
Pine tar	1 part by weight

Place the shellac in a double boiler using water in the outer member. Add the pine tar and permit to digest with occasional stirring until the mass is homogeneous; this will take about five hours. Pull out like taffy and make into sticks. The cement can be made harder or softer by varying the amount of tar.

General Hints

Glues of all kinds are useful for wood, leather, paper and glass, where the joints are not required to be waterproof.

For waterproof joints of nearly all substances, including metals, shellac may be used. Flakes of solid shellac may be used with heat or it may be used as a solution in alcohol.

Kotinsky cement, Chatterton's compound and other resinous cements are used for similar purposes and in the same way as solid shellac. Glass cells made up with compounds of this nature may be made impervious to alcohol by painting over the joints with a rubber cement made by melting up small pieces of rubber tubing and adding carbon disulfide to make a thin syrup.

For celluloid a cement made by dissolving celluloid shavings in acetone is recommended.

Brass fittings are usually cemented on glass tubing with sealing wax. The glass tube should be wound with thread or twine to secure a close fit. The glass and the brass fitting should be warmed

slightly above the melting point of wax. (Thick or pressed glass should be warmed slowly.) Wax may be applied to both parts and the thread well saturated with the melted wax. Enough should be used to insure filling the space completely. Join the parts while the wax is very soft and clamp in position until it is thoroughly cold.

For optical purposes, cementing glass, etc., Canada balsam is universally employed, and makes a permanent and nearly invisible joint.

Laboratory Adhesive

Nitrated cotton (3 sec)	20 grams
Nitrated cotton (30 sec)	10 grams

Make up a solution of:

Di methyl ketone (acetone)	100 milliliters (c.c.)
Amyl acetate	45 milliliters (c.c.)
Methyl acetate	15 milliliters (c.c.)
Ethyl acetate	15 milliliters (c.c.)
*Ethyl abietate	1.5 milliliters (c.c.)

* ½ above of castor oil is a substitute.

Using the latter solution as solvent, add the above mixture of the two cottons until the solution is of the consistency of syrup. Dissolving the cotton takes about two hours. If the mixture is too thick, a little more of the above solvent, which should be kept on hand, is added.

The above solution should not blush when applied to any surface. It should dry quickly into a tough film which is stable over a long period owing to the plasticizer, ethyl abietate.

The above is useful for cementing cross hairs, coating labels, sealing rubber to tubing, etc.

In case a more flexible film is desired the amount of the plasticizer may be doubled. In case of blushing increase amyl acetate.

Litharge Cement for Joining Metal to Glass

In the preparation of tanks with glass sides or bottom, it is desired to make these water tight by cementing the glass to the iron frame or to repair the leaks that may occur.

Litharge (PbO)	260 grams
Glycerin solution (glycerin 2 parts, water 1 part)	100 milliliters (c.c.)

Place the litharge in a mortar, add the diluted glycerin slowly while grinding. Mix thoroughly by grinding a short time. Heat will be evolved and the mixture will begin to set. While still soft, pour it into place and by means of a spatula work it into position as in the case of putty. Allow to stand for a day when it will be thoroughly hard.

If desired, it may be covered with a layer of white lead or aluminum paint.

Mucilage or Paste

Gum arabic (gum acacia)	1 part
Rice starch	1 part
Sugar	4 parts
Water	10 parts

Warm the gum arabic with some of the water until it has a jelly-like consistency. Mix the sugar and starch with enough water to make a smooth paste. Combine these two mixtures, and boil until the starch is clear.

Shellac Cement

De Khotinsky Type

(Benzene Resistant)

Note: Most recipes for de Khotinsky cement call for pine tar, to the amount of 40 to 50 %, as the material with which shellac is plasticized for the application in question. Recent investigation indicates that pine tar is inferior to the creosote plasticizer recommended below.

Prepare the plasticizer by mixing one volume of terpineol with three volumes of beechwood creosote (alkali-soluble). Coal-tar creosote, not completely alkali-soluble, will not do.

Heat from 12 to 25 grams of the plasticizer to about 130° C. With constant stirring add 85 grams of shellac as fast as it dissolves smoothly. When the mixture is homogeneous, allow to cool until it will barely flow from the vessel, and pour into molds which have been lightly but completely covered with petrolatum. The use of only 12 grams of plasticizer gives a very hard cement; 25 grams gives a very soft product.

Shellac-Wax Cement

(Benzene Soluble)

Rosin	35 grams
Shellac	20 grams
Beeswax	20 grams
Talc, fibrous (asbestine pulp)	0 to 30 grams

Melt the rosin in a large (6 or 8 in.) hemispherical iron pan, add the shellac and beeswax with stirring. Heat strongly with a large Bunsen flame so that the temperature reaches 360° C. in six minutes; then extinguish the burner. When the temperature has reached about 275° C., add the talc, if any is to be used. Finally when the mixture is so viscous that it will barely pour from the pan, pour into metal molds which have previously been very thoroughly scoured with washing powder and thickly coated with aqueous dextrine paste which is still wet. The talc gives a more viscous cement at temperatures just above the melting point.

Transparent Sealing Resin

A transparent resin which adheres well to glass, quartz and metals may be made by heating together equimolal quantities of phthallic anhydride and ethylene glycol for 24 hours at 200° C. The resin softens at 95°–110° C. It is unaffected by water but slowly dissolved by organic solvents and is particularly useful for high-vacuum seals.

Vacuum Wax

Wax for coating joints which may be used for ordinary vacuum distillations etc. where the temperature does not get too high:

Melt together equal parts (by weight) of beeswax and rosin. The product is pliable and easily removed from apparatus by simply using hot water.

CLEANING COMPOUNDS AND METHODS

Alcoholic Sodium Hydroxide Solution for Cleaning

Dissolve 120 grams sodium hydroxide in 120 c.c. water. Dilute to 1 liter with 95 % alcohol.

Burette Cleaning Assembly

A burette cleaning assembly may consist of a 300 c.c. beaker of cleaning solution mounted on a ring stand having a 7 × 9″ base. Higher on the stand is a clamp for engaging the burette to be cleaned and still higher a mounting of $\frac{3}{16}$″ rubber tubing connected with an aspirator. The cleaning solution is heated, the burette placed with its top dipping into the cleaning solution while the aspirator tubing is slipped on the delivery end of the burette. When hot cleaning liquid has been aspirated to near the glass stopcock or pinch-cock, the cock is closed and the aspirator tubing slipped off, leaving the cleaning solution in the burette. After a minute or so, the cock is opened and the cleaning solution is allowed to run out of the burette, which will leave a uniform film if the burette is clean. The burette is transferred to a sink and after cooling is rinsed with tap and distilled water. By this means 50 burettes per hour may be made ready for use.

Brown Stains on Burettes

Brown stains left on the inside of burettes used for $KMnO_4$ solutions may be removed by filling the burette with $FeSO_4$ solution after which the liquid is removed and completely washed out. A convenient, ready for use, solution of $FeSO_4$ may be made by placing small nails in a dilute H_2SO_4 solution, keeping the flask closed except for a hydrogen vent, thus preventing oxidation of the iron.

Cleaning Engler Flasks

To thoroughly remove all of the carbonaceous deposit baked in the bottom of an Engler flask from gasoline distillation, place 2 or 3 grams of commercial Na_2SO_4 in the flask to be cleaned; apply heat directly to the flask from a Bunsen burner. Heat until all the carbon residue has been loosened. Cool, rinse and drain.

Cleaning Fermentation Tubes and Other Glassware

Fermentation tubes (used in water testing) and other glassware difficult to clean in the ordinary way, may be cleaned as follows:

Moisten the inside of the tube with ethyl alcohol. Pour off the excess alcohol, leaving not to exceed two c.c. of the liquid in the tube. Add ten c.c. of concentrated nitric acid and let it stand. Soon a vigorous reaction takes place with the elimination of large quantities of nitrogen dioxide. When the reaction stops, wash with water. As some nitric acid may be blown out of the tube, it should be placed in a sink (preferably in a hood) until the reaction ceases. Do not close the tube.

Cleaning Fluid

An excellent solution for cleaning grease stains from cloth or leather consists of the following:

CCl_4	80 %
Ligroin	16 %
Amyl alcohol (ter.)	4 %

Cleaning Mercury

Mercury may be cleaned sufficiently for many laboratory purposes without distilling. Allow the mercury to fall in a fine spray into a quantity of dilute nitric acid, 25 parts of acid to 75 parts of distilled water. After being passed through the acid one or more times it should be passed through distilled water and dried. Most of the water may be removed with a clean filter, and the mercury heated in a porcelain dish to about 110° C. To produce the spray the stem of a glass funnel may be drawn down so as to leave only a small opening for the escape of mercury or a glass tube with a capillary point attached to a funnel with a tightly fitting rubber tube.

A three- to four-foot length of one-inch glass tube closed at one end and supported in a vertical position may be used to contain the acid solution. If a small glass tube be fused into the lower closed end of the large tube, and bent so as to stand up for a distance a little greater than 1/13.6 the column of acid solution in the large tube, a U-tube is formed in which a short column of mercury supports the long column of acid solution.

The end of the small tube should be bent over at the top so as to facilitate the delivery of the mercury and a short piece of clean rubber tubing with a pinch-cock put on at the start; as soon as mercury enough has collected in the bottom of the tube the pinch-cock may be opened. The mercury will rise nearly or quite to the top of the small tube, and as the quantity increases will be delivered from the small tube as fast as it falls in the spray.

The reversed end of the small tube should be short to avoid forming a siphon, which would completely empty the apparatus.

An efficient procedure, especially if the mercury is greasy, consists in spraying the mercury by means of the above apparatus, first, through a dilute solution (10 %) of potassium hydroxide, then through dilute nitric acid (10–15 %) and finally through distilled water.

Cleaning Optical Surfaces for Silvering

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

Probably the most important part of the silvering process is the proper cleaning of the surface to be silvered.

The surface is thoroughly cleaned of grease or other organic matter by the usual methods, using alcohol or chromic acid. Then it should be carefully cleansed with strong nitric acid, the whole surface being firmly rubbed with clean cotton tied to a rod of wood or glass. Care should be taken not to injure the surface. Rinse with water, and then wash the surface thoroughly with a strong solution of caustic potash, rubbing with a cotton brush as before. Finally, rinse with distilled water, and keep the surface wet until it is placed in the silvering solution. If the distilled water wets the whole surface uniformly the cleaning may be sufficient; if it does not wet uniformly, the operations must be repeated. The fingers should not touch the edges of the glass during the latter cleaning operations, as a layer of organic matter is apt to spread over the surface and render the silvering uneven.

Dr. Brashear recommends that the surface, after the washings described above, be rubbed with prepared chalk on a cotton wad until it is thoroughly dry and clean. It may then be put into the silvering solution at one's convenience.

Cleaning Solution for Glass

35 c.c. saturated sodium dichromate (technical)
1 liter conc. sulfuric acid poured into the dichromate solution

Avoid contact with the flesh or clothing.

Cleaning Solution

Trisodium phosphate	2 oz.
Sodium oleate	1 oz.
Distilled water	1 pint

Soak apparatus in the warm solution 10–15 minutes, then brush with a stiff brush.

Iodine Stains

Iodine stains can readily be removed from clothing by washing the stain with a 10 % solution of sodium thiosulfate ("hypo") in water.

Paint Brush Cleaner

(1)	Kerosene	2 pints
	Oleic acid	1 pint
(2)	Aqueous ammonia (conc.)	¼ pint
	Denatured alcohol	¼ pint

Stir (2) into (1) until uniform. To clean brushes, place in the mixture over night. Wash thoroughly with warm water.

Removal of Carbonaceous Matter

A 10–15 % solution of NaOH or KOH removes carbon etc. quickly. Rinse well with acid and H_2O.

Removing Carbon Deposits from Flasks

First rinse flask with acetone or carbon disulfide to remove traces of oil or tar. Add a few grams of magnesium nitrate. Heat gradually over a free Bunsen flame till water is all expelled and the magnesium nitrate melts. Rotate the flask to distribute the melt and continue the heating till the brown fumes of nitric oxide cease to evolve. Finally cool and dissolve the residual magnesium oxide in dilute acid by boiling.

Large deposits of carbon or tar will require a repetition of the above procedure.

Removing Carbon Residue from Glassware

Tri-sodium phosphate (Na_3PO_4)	2 tablespoonfuls
Sodium oleate	1 tablespoonful
Soft water	1 quart

Allow to stand in the solution for several minutes, brush off the incrustation and rinse with water.

COLORED LIQUIDS

For rendering columns of water easily visible, add a few drops of one per cent alcoholic solution of fluorescein to a liter of water. The dilute solution of fluorescein is bright green by reason of its fluorescence, although colorless by transmitted light.

A small quantity of an aqueous (1 %) solution of uranine (the sodium salt of fluorescein) may be used in place of the alcoholic solution mentioned above.

If liquids showing color by transmission are desired, dilute aqueous solutions may be made with any of the following dyes:

Dye	Color
Erythrosine	Pink
Eosine	Pink (green fluorescence)
Rhodamine B	Pink (red fluorescence)
Ponceau 2R	Scarlet
Naphthol green	Green
Methylene green	Bluish green
Methylene blue	Blue
Methyl violet	Purple

CROSS HAIRS

The spider lines which serve as an index in reading telescopes may be quickly replaced in an emergency by single silk fibers (from ordinary sewing silk) attached by soft wax. Single fibers may easily be removed from an untwisted strand.

Spider web should be used in permanent work. The fibers of the egg nest of certain species are employed and may be obtained of most dealers in scientific apparatus. In mounting them the following suggestions may be useful: The cross hair diaphragm of the telescope should be removed and clamped in a horizontal position. A bow of brass wire, about No. 28, should be employed to stretch the fiber. A background of black velvet makes the fibers more easily visible. With soft wax or other convenient adhesive ready on both tips of the bow, a fiber of the required length is to be disentangled with tweezers and wrapped several times about the ends of the bow under tension sufficient to straighten the fiber. The fiber, now conveniently handled by the wire bow, should be cautiously lowered onto the diaphragm in the proper position, the wire left hanging.

A small drop of shellac varnish applied at each side will hold the fiber in position as soon as it is thoroughly dry, after which the ends of the fiber should be cut away.

DIALYZERS

As a substitute for parchment and similar natural membranes, it has been found that those made from cellulose trinitrate are superior. Parlodion (DuPont) may be used, dissolving one part of the nitrate in 2 each of ethanol and ethyl ether. The water adhering to the Parlodion should first be removed (the shreds are preserved by covering with water), otherwise a clear solution will not be obtained. Cut the round end off a $\frac{3}{4}''$ or $1''$ test tube, and dip the flared end of the tube into the alcohol-ether solution of Parlodion. Upon removing the tube from the solution a film will be found across the tube and after evaporation of the solvents the film will be found to be of sufficient strength to meet the purposes of a dialyzer. The liquid to be dialyzed is poured into the tube and contents are then set in a beaker of water. In a short time the working of the semi-permeable membrane will be shown by the rise of the level of the liquid inside the tube.

EXPANSION OF GLASSES, TEST FOR EQUALITY OF

In order to compare the coefficients of expansion of two pieces of glass, prior to sealing them together, melt the drawn out ends of each piece to beads; press these molten beads together with tweezers and draw into a thread. If the glasses can be sealed

together, the thread will be straight; otherwise, it will curve because of the different coefficients of expansion.

FLUORESCENT SCREENS

For observations of the ultraviolet spectrum, moisten a small quantity of anthracene with water and brush a thin layer over a ground-glass surface. On drying most of the anthracene will adhere to the glass. The prepared surface should be placed so as to receive the radiation directly, glass being comparatively opaque to the shorter wave lengths.

GLASS GRINDING FLUID

Turpentine	45	c.c.
Ether (ethyl oxide)	22.5	c.c.
Camphor gum	31	g

To be used with powdered emery for grinding glass.

For smoothing edges a sheet of emery cloth moistened with the above solution may be used.

Plane surfaces should be ground on thick plate glass.

For grinding glass stoppers use coarse emery, turn in one direction, finish with fine emery.

GLASS GRINDING MEDIUM

Glycerin may be used instead of a camphor-turpentine mixture for a medium in which to suspend emery powder for grinding glass. Glycerin has body enough and is sufficiently viscous to carry the emery well, and besides this it is water-soluble, thus making it very easy to wash away the excess grinding agent when the job is done or when it is desirable to make a close inspection of the work done.

HEATING BATH

A bath fluid at temperatures above 150° G. and which does not appreciably affect glass is prepared by fusing 10 parts of potassium nitrate with 8.5 parts of sodium nitrite.

HEATING BATHS

For uniform heating of reactions the following materials have proven satisfactory:

For temperatures up to 100° C.	Steam
For temperatures from 100° − 250° C.	Crisco or Nujol
For temperatures from 200° − 300° C.	*o*-tolyl phosphate
For temperatures above 250° C.	Wood's metal.

HECTOGRAPH FILLER

Ingredients: ½ oz. of ground (dried) glue; 2 oz. of dried gelatine; 18 fluid oz. glycerin. These amounts should provide sufficient filler for a pan 12″ × 9″ × ½″.

Mix the glue with water and digest it on a water bath (a double boiler may be used) until it has the consistency of cream and is thoroughly melted. Soak the gelatine in cold water till soft free it from as much water as is possible by pressure in a cheesecloth and then melt it on a water bath or in a double boiler. Pour the three liquids together, and after they are thoroughly mixed, pour them into the pan. If any bubbles appear on the surface

of the filler, scrape them off with the edge of a piece of cardboard while the filler is hot. Do not use the filler until at least six hours after it has been poured into the pan. The materials gel slowly. Keep the pan level and covered until its contents is no longer fluid.

HECTOGRAPH INK

Violet

Aniline violet	1 oz.
Hot water	7 oz. fl.

On cooling, add:

Alcohol	1 oz.
Glycerin	$\frac{1}{4}$ oz.
Carbolic acid (phenol)	a few drops

Black

Nigrosine	1 part
Water	14 parts
Glycerin	4 parts

HYDROGEN SULFIDE

Pure hydrogen sulfide may be generated by allowing distilled water to drop on aluminum sulfide.

HYDROGEN SULFIDE SUPPLY

Mix and heat slightly 3 parts by weight of sulfur with 1 part by weight of paraffin. Then mix with sufficient shredded asbestos to make a porous mass. Partly fill an 8″ Pyrex test tube, connect with delivery tube and safety bottle. Heat. Furnishes good supply of H_2S. No leakage into the room as generation of H_2S ceases as soon as heat is removed. Mixture keeps. Test tube may be heated over again until reactants are used up.

INK FOR GLASS MARKING

Barium sulfate	15 parts by weight
Ammonium bifluoride	15 parts by weight
Ammonium sulfate	10 parts by weight
Oxalic acid	8 parts by weight
Glycerin	40 parts by weight
Water	12 parts by weight

If too thick, add more water. If the action is too slow, up to 5 % of sodium fluoride may be added. Use in a hood or well ventilated room.

LABEL PROTECTION

Collodion for Labels on Bottles

Dissolve 3–4 grams pyroxylin in 100 c.c. 1:3 mixture of alcohol and ether (25 c.c. absolute alcohol, 75 c.c. dry ether).
First soak the pyroxylin in the alcohol, then add the ether.

Labels for Bottles

Labels should be written in India Ink. They can be made waterproof and durable by coating with a saturated solution of paraffin in benzene.

Lacquer for Protecting Labels

An excellent lacquer for protecting labels may be made by dissolving 20 grams of vinyl acetate polymer (Vinylite A) in 100 c.c. of a mixture of 3 parts of toluene and 1 part of 95 % alcohol. This lacquer forms a colorless, transparent film which resists most reagents very well.

Protecting Varnish for Labels

Typed labels may be protected by several coats of a varnish made by dissolving ordinary tooth brush handles in acetone. The quantity of solvent should be adjusted to give a convenient viscosity. The varnish is water and acid resistant.

LOW MELTING ALLOY

The following alloy, Wood's metal, melts at about 65° C.:

Bismuth	50	parts by weight
Lead	25	parts by weight
Tin	12.5	parts by weight
Cadmium	12.5	parts by weight

LUBRICANT, DRY

Melt a quantity of paraffin and add as much fine flake or powdered graphite as is readily moistened by the melted wax. Cool and cut while soft into convenient sticks.

This lubricant when rubbed on the surfaces involved, adheres and greatly reduces friction. It is particularly useful when one or both of the surfaces are of wood or other non-metallic substance.

MILDEW PREVENTION ON LEATHER BOOK BINDINGS

Make a 2 % to 5 % solution—not more than 5 %—of copper sulfate. Immerse a soft towel or cloth in this solution. Remove the cloth and thoroughly wring out. Then hang out to dry. When thoroughly dried, it can be used to rub leather bound books. One treatment of the cloth will easily take care of scores or a hundred volumes, and the leather will not be marked by the chemical.

MIRRORS FOR SPECTROMETER ADJUSTMENT

A small square of thick plate glass with edges ground smooth and silvered on one surface affords a means of accurate adjustment.

To avoid the necessity of frequently resilvering, which arises where the mirrors are in constant use, the following course is suggested:

From selected German plate mirror 2 to 3 mm thick, cut two pieces of the same size, say 4 × 5 cm. Remove the protective layer of varnish or paint from both pieces by soaking in alcohol and rubbing with cotton, being careful not to injure the silver surface. From one piece remove every trace of varnish by repeated rinsing, dry and polish the silver surface thus exposed by stroking lightly with a chamois rouge pad. From the other piece remove the silver by nitric acid, wash thoroughly in distilled water and dry. Cement the clear piece on the silver face of the other with Canada balsam. This is accomplished by placing two or three drops of Canada balsam in xylol (obtained in collapsible tubes) on the center of the silver face, and evenly lowering upon it the clear glass. The balsam should spread rapidly to the edges of

the plates. Minute bubbles of air in the balsam film are harmless: if large bubbles are present the plates should be slipped apart, cleaned with alcohol and the process repeated.

The balsam will be sufficiently hard in a few days to allow the excess to be scraped from the edges and the plates bound together with lantern slide binding strip. Gentle heat may be used to harden the balsam more rapidly.

PHENOL (CARBOLIC ACID) BURNS

To c. p. glycerin add bromine until slightly colored or saturated. Keep in glass stoppered bottle and apply quickly to phenol burns. The bromide reacts instantly with the phenol to form phenyl bromides.

POLARITY TEST PAPER

Dissolve one gram of phenolphthalein in a small quantity of alcohol. Add the solution of phenolphthalein to 100 c.c. of a 10 per cent solution of potassium chloride in distilled water. Filter paper should be soaked in the solution and dried. A strip of paper moistened with water and placed in contact with the two terminals will show a bright red stain at the negative terminal.

PURIFICATION OF ALCOHOL

To remove aldehydes from alcohol intended for use in the preparation of alcoholic solutions of sodium or potassium hydroxide, add to one liter of alcohol 5 to 10 grams of aluminum or zinc and 8 to 10 grams of potassium hydroxide; boil under reflux for 20 minutes, and distil. Best results are obtained if an all-glass apparatus is used. Alcoholic solutions, prepared with alcohol so treated, will not discolor if the purification of the alcohol has been carefully carried out.

RESISTANT PAINTS AND VARNISHES

Acid Proof Wood Stain

Solution No. 1	Solution No. 2
125 grams of copper sulfate	150 grams of good fresh anilin oil
125 grams of potassium chlorate	180 grams of concentrated hydrochloric acid
1000 grams of water	1000 grams of water

Wood must be free from paint, varnish, grease or chemicals. Apply two coats of solution No. 1 boiling hot with a paint brush, allowing each coat to dry thoroughly before the next coat is applied. Then apply two coats of solution No. 2 in the same way. When the wood is completely dried wash off excess chemicals with hot soapsuds. Finish with raw linseed oil. Polish comes from rubbing the oil down well with a cloth or sponge. Whenever the tables get dingy again go over them with a coat of linseed oil and rub smooth.

Resistant Coal Tar Varnish

A resistant varnish is made from coal tar pitch as follows:

Coal tar pitch....................	65 parts by weight
Phenol....................	5 parts by weight
Benzene....................	30 parts by weight

Resistant Paint

The following paint when used on galvanized iron has been found to hold up well, without cracking or peeling in a three year's test. It can also be used on black iron, tin, copper, or stone such as is used for laboratory desk tops. It withstands dilute acids.

Formula: Stir in 10 parts by weight of benzol into 30 parts by weight of ordinary thin coal tar. Then add with vigorous stirring 10 parts by weight of Silica Black (a new product patented under U. S. No. 1,940,352).

SCALE POLISH

To brighten up refractometer and polarimeter scales without injury to the metal rub with bone black or clarifying charcoal. A dry cloth with a little of the bone black is rubbed on the scale until a bright polish is produced. The divisions then stand out clearly and are easily read. The great advantage is that the fine lines are not worn away and no corrosive material is left to cause discolorations.

SILVERING GLASS

Brashear's Process

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

Two solutions are required, one, the reducing solution, should be prepared at least a week before it is used, and it may be made in large quantity and kept in stock with advantage; the other solution is to be prepared when used.

Reducing Solution

Distilled water	700 c.cm.
Pure sugar (loaf, granulated or rock candy)	80 g.

When dissolved add

Alcohol	175 c.cm.
Strong nitric acid (sp. gr. 1.42)	3 c.cm.
Add water to make	1000 c.cm.

For silvering, the mirror may rest face up on the bottom of a suitable dish; it may stand on edge, or be supported in any manner, face downward, dipping into the upper part of the solution. In the latter case, the mirror may be fastened with wax to a stick laid across the dish, or it may be supported on glass feet or on paraffined wood wedges. Dr. Brashear recommends that the mirror, if round, form the botton of the silvering dish, which is completed by wrapping a strip of paraffined paper around the edge of the mirror, this being held in place by rubber bands or fastened with several wrappings of cord.

Having selected a dish and support for the mirror, measure with water the quantity of solution that will be required to make a layer a centimeter or two thick over the surface to be silvered. For each 150 c.cm. of final solution, 1 g. of silver nitrate and 0.5 g. of caustic potash (purified by alcohol) will be required. Dissolve the silver and potash separately, using quantities of water of the proportion of 100 c.cm. to 1 g. of the solid. Ordinary graduates or flasks are the most convenient form of vessel in which to mix the solutions. Into the silver nitrate solution pour a few drops of dilute aqua ammonia. The solution will turn to a dark brown color; add ammonia little by little till the precipitate is nearly but not quite redissolved. Now add the potash solution,

when a precipitate will again be formed. This is to be nearly, but not entirely, redissolved by the addition of more ammonia, a few drops being sufficient this time. After the ammonia has been added shake or stir the solution well and wait a minute or two to be certain that it does not entirely clear. If by chance too much ammonia has been used, a little silver nitrate is to be dissolved and added, a few drops at a time, till a permanent precipitate is formed. This excess of silver must be present, the solution showing a decided brown tint. The solution may be filtered, though usually this is not necessary.

A quantity of reducing solution equal to about a twenty-fifth part of the solution just prepared is measured out. The mirror, having been properly cleaned and rinsed with distilled water, is placed in position. The reducing solution is poured into the silver and potash solution, and mixed by a quick shaking of the graduate or stirring with a glass rod; the whole is then poured into the dish. If the mirror is immersed face down, care is necessary to remove air bubbles; the mirror may well be immersed after the solution is in, being dipped in at one side first. If the mirror is at the bottom of the dish, after cleaning it is covered with a thin layer of water, and the prepared solutions are poured into the dish without further trouble. In the latter case the dish must be rocked during the time of deposition.

The solution soon turns to a black color, which in a few minutes will turn to a brown; and when it becomes a light gray and the precipitate is flocculent, which may be in ten or fifteen minutes, the operation is at an end. If the mirror is allowed to remain in the solution too long, the surface will have a bleached appearance, which polishing will hardly remove. Remove the mirror, rinse with water, and carefully wipe off the sediment with a tuft of absorbent cotton. It is then set on edge to dry; a rinsing with alcohol will facilitate the drying, or all water may be safely taken up by pressing clean blotting paper over the surface.

When dry, the surface may be polished, if necessary, with a small pad of chamois leather stuffed with cotton, on which is spread a little rouge. Small, circular strokes of the pad, with light pressure, will soon bring out the deep luster of the silver.

A uniform temperature of the bath and the glass, of about 20° is essential to success.

Since fulminating silver is liable to be produced by the action of ammonia on silver oxide, especially in a warm room, all solutions should be thrown away as soon as the silvering operation is completed. The used solutions may be poured into a large jar, in which is thrown some common salt; this causes the silver to be precipitated as the chloride, and about 90 per cent of the original silver may be recovered.

Rochelle Salts Process

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

For depositing the uniform thin film of silver required on the half-silvered glass of the interferometer, the following method is more suitable than the one described above, as the silver is deposited more slowly. If a thick film is desired, two or more successive deposits may be made, each of which may require an hour's time.

Dissolve 5 g. of silver nitrate in 300 c.cm. of distilled water, and add dilute aqua ammonia until the precipitate formed is nearly, *but not entirely*, redissolved in the manner explained in

the preceding method. Filter the solution and add water to make 500 c.cm.

Dissolve one g. of silver nitrate in a small quantity of water and pour into about half a liter of boiling water; dissolve 0.83 g. of Rochelle salts in a small quantity of water, and add to the boiling solution. Continue the boiling for half an hour, till the gray precipitate collects as a powder in the bottom of the flask. Filter hot, and add water to make 500 c.cm.

These solutions may be kept in the dark for a month or two.

For silvering, equal volumes of the two solutions are mixed, and the glass is supported in the mixture in whatever fashion is convenient. Various methods are mentioned in the preceding article. The thickest possible deposit may require an hour's time. A second deposit may be made upon the first if necessary to secure the desired thickness. The drying and polishing may be carried out as described above.

A half-silvered film will be produced in about a minute; only experience can determine when the proper thickness has been secured. The glass appears as though it were very lightly smoked. A film that reflects a little more than half the light incident at 45° is desirable for interferometer use. A simple method of testing is to look at two similar gas flames, one seen through the film and the other seen reflected by it. It is well to silver at once all four surfaces of the two plane-parallel plates of the interferometer and to select for use that film which is of the proper and most uniform thickness.

SOAP SOLUTION FOR SOAP FILM EXPERIMENTS

Pure castile or palm-oil soap	1 oz.
Distilled water	8 oz.
Pure glycerin	4 oz.

Cut the soap in thin shavings and dissolve in the water. When the solution is complete, add the glycerin and mix very thoroughly. On standing the liquid becomes clear at the bottom. The clear portion may conveniently be removed by a siphon and preserved indefinitely.

SODIUM FLAME

An intense sodium flame is readily obtained by placing a small lump of rock salt in the center of the screen on a lighted Meker burner.

SODIUM LIGHT

Paper is to be soaked in a saturated solution of common salt, borax or other salt of sodium, and dried. When wrapped around a Bunsen burner, secured by a twist of wire and pushed up into the edge of the flame, a sodium flame of considerable intensity is obtained. As the ash of the paper breaks away it must be occasionally raised. Lithium chloride may be used in place of or with sodium salt to give the lithium line for spectrometric measurement. Sheet asbestos (thin) may replace the paper if desired. Since the asbestos is not consumed it is necessary to moisten the mantle with salt solution at intervals.

SOLDERING PYREX GLASS TO METAL

Dip the Pyrex glass tube to be soldered into a solution of chlorplatinic acid (or platinic chloride may be substituted) made by

preparing a mixture consisting of 0.2 gram of the acid with 5 c.c. each of alcohol and ethyl ether to which 4 or 5 drops of turpentine have been added. After dipping the tube, carefully burn all the adhering liquid away leaving a film of platinum metal. That film will serve to hold the solder to the Pyrex glass and in doing so makes a very satisfactory gas-tight joint for a metal to glass connection.

SOLDERS

Composition by weight						Temperature of fusion	Metals for which it is used	Flux commonly used
Lead	Tin	Copper	Zinc	Silver	Gold			
1	1	....	....	....	..	188° C.	Lead	Tallow
3	5	....	....	....	..	176	Zinc	Zinc chloride 25% HCl

STOPCOCK LUBRICANTS

Seal for Ground Glass Joints

Glycerin makes a very satisfactory seal for ground glass joints to prevent leakage of petroleum ether, ethyl ether or any other fluid in which glycerin is insoluble. Glycerin on the ground glass surface prevents sticking and so allows for the easy dismantling of the apparatus.

Stopcock Grease

Shepherd and Ledig (J. Ind. Eng. Chem. 19, 1059, 1927) prepare stopcock grease from the following ingredients by mixing with continuous stirring for 190 hours at 155° C., then placing the mixture in small 2 oz. containers, immediately chilling the contents on ice and allowing to age for 10 days before use. For high vacuum: 31 parts crepe rubber, 24 parts white vaseline, 5 parts paraffin (m. p. 36° C.); for general lubricant: 6 parts crepe rubber, 7 parts vaseline, 1 part paraffin; for light lubricant: 10 parts smoked sheet or pale crepe rubber, 18 parts vaseline and 1 part paraffin (m. p. 30° C.).

Stopcock Grease

Black rubber (red or pure gum)	1 part
Paraffin	2 parts
Vaseline	4 parts

Melt the paraffin and vaseline together, add the rubber slowly and in small pieces taking care not to burn the rubber. A larger quantity of vaseline may be desirable.

Stopcock Lubricant

Petrolatum (500 grams) and raw crepe rubber (50 grams) are stirred together and kept in an oven at 125°–150° C. for several days, or until the mixture is homogeneous.

Stopcock Lubricant

Standard Viscous Oil No. 32 (Standard Oil Co. of California)	200 grams
Aluminum stearate	50 grams

Dissolve the stearate in the oil, heated to about 150° C., and cool. This makes an extremely sticky, ropy, tough adhesive for ground glass surfaces.

Stopcock Lubricant

In the laboratory it is often desirable to have a stopcock lubricant that will not dissolve away with the ordinary fat solvents such as the hydrocarbons or chlorinated hydrocarbons. In some set-ups the ordinary stopcock greases are quite useless, and syrupy phosphoric acid is very unsatisfactory.

A paste of Bentonite (colloidal clay) and glycerin may be used for such a purpose. One can adjust the viscosity of the paste to suit his needs. Such a lubricant is entirely unaffected by the non-aqueous solvents, and even in the presence of water holds remarkably long, probably due to the fact that the Bentonite makes a jelly with either glycerin or water. In addition it has the very decided advantage of permitting a stopcock lubricant to be used at temperatures up to or even well above 100° C. The viscosity does not diminish very much with rise in temperature.

UNIVERSAL WAX

(1) A soft wax useful in the laboratory may be made by melting together paraffin, vaseline and paraffin oil in various proportions according to the pliability desired.

(2) Another authority recommends equal quantities of beeswax and turpentine (by weight). It is customary to color the wax by adding finely-powdered Venetian red.

(3) Melt together 1 part of Venice turpentine and 5 parts of beeswax. Color with vermilion.

PHOTOGRAPHIC FORMULAE

Pure water, preferably distilled, should be used in all solutions. Chemicals should be dissolved in the order given.

Desiccated or anhydrous sodium carbonate and sodium sulfite are specified in the following formulae. If the crystalline forms are employed, a larger quantity must be used.

Sodium carbonate exists in three forms: the anhydrous or desiccated, Na_2CO_3; the monohydrate, $Na_2CO_3 \cdot H_2O$; "washing soda," $Na_2CO_3 \cdot 10H_2O$. If the monohydrate is substituted for the desiccated, 1.7 times the specified quantity should be used. If the "crystal" form $Na_2CO_3 \cdot 10H_2O$ is substituted for the desiccated, 2.7 times the specified quantity should be used.

Sodium sulfite exists in two forms; the anhydrous or desiccated, Na_2SO_3, and a form, $Na_2SO_3 \cdot 7H_2O$. If the latter "crystal" form is substituted for the desiccated, 2 times the specified amount should be used.

Quantities required are given in both English and metric units. The values are, in most cases, not interchangeable since the amounts of water are not the same. In deference to recent usage quantities of liquid are specified in millimeters (ml). The milliliter is 1.000027 cubic centimeters; the units are, of course, interchangeable for photographic formulae. The U. S. avoirdupois system of weights is used.

The following abbreviations are employed:

anh.	anhydrous
c.c.	cubic centimeter
g	gram
gal.	gallon
gr.	grain
l	liter
min.	minim
ml	milliliter (equivalent to cubic centimeter, cm^3 or c.c.)
oz. (av.)	ounce (avoirdupois)
oz. fl.	fluid ounce
qt.	quart

DEVELOPERS FOR PLATES AND FILMS

When a time of development is suggested, it is intended to serve as a guide only. Individual requirements as to density and contrast vary. Greater or less contrast may be obtained by developing for a longer or a shorter time respectively.

Normal Developers

AMIDOL (Diaminophenol hydrochloride)

1

Water	10 oz. fl.	1000 ml
Sodium sulfite, anh	120 gr.	29 g
Amidol	30 gr.	7 g
Potassium bromide	6–10 gr.	1.4–2 g

Amidol oxidizes so rapidly in solution that it is customary to make up this developer immediately before it is to be used. The time required for development is from 3 to 5 minutes at 18° C. or 65° F.

2

Stock solution of sodium sulfite may be prepared:

Sodium sulfite, anh	2 oz.	100 g
Potassium metabisulfite	0.5 oz.	25 g
Water	20 oz.	1000 c.c.

Boil after dissolving in warm water. Developer is made when needed by adding dry amidol to the stock solution of sulfite which keeps for a long period.

Stock solution of sodium sulfite	2 oz.	200 c.c.
Water	10 oz.	1000 c.c.
Amidol	20–30 gr.	4.5–7 g

Athenon. See *Glycin*

Elon-Pyro (Eastman D-7 *)

Stock Solution A

Water (about 125° F.) (52° C.)	16 oz.	500 c.c.
Elon	$\frac{1}{4}$ oz.	7.5 g
Sodium bisulfite	$\frac{1}{4}$ oz.	7.5 g
Pyro	1 oz.	30 g
Potassium bromide	60 gr.	4.2 g
Water to make	32 oz.	1 l

Stock Solution B

Water	32 oz.	1 l
Sodium sulfite, anh	5 oz.	150 g

Stock Solution C

Water	32 oz.	1 l
Sodium carbonate, anh	$2\frac{1}{2}$ oz.	75 g

For tray development take 1 part of A, 1 part of B, 1 part of C and 8 parts of water. Develop about 7 to 9 minutes at 65° F. (18° C.).

For tank development take 1 part of A, 1 part of B, 1 part of C and 13 parts of water. Develop about 9 to 12 minutes at 65° F. (18° C.).

This developer can be used for two or three weeks if the volume is maintained by adding fresh developer in the proportion of 1 part each of A, B, and C to 4 parts of water. It is usually necessary to increase the development time as the developer ages.

Glycin (Parahydroxyphenyl glycin)

Stock Solution

Water	10 oz. fl.	1000 ml
Sodium sulfite, anh	300 gr.	68.5 g
Glycin	120 gr.	27.5 g
Sodium carbonate, anh	240 gr.	54.8 g

For tray development dilute with 4 parts of water to 1 of stock solution. Develop 6 to 10 minutes.

* For a complete collection of photographic formulae see "Elementary Photographic Chemistry," Eastman Kodak Company, Rochester, N. Y.

For tank development use 15 parts of water to 1 of stock solution and develop 20 to 30 minutes. Glycin has better keeping qualities than any other single solution developer. The image is free from fog and stain and has a fine grain.

Hydroquinone

Water	10 oz. fl.	1000 ml
Sodium sulfite, anh	220 gr.	50 g
Hydroquinone	50 gr.	11.5 g
Sodium carbonate, anh	162 gr.	37 g

For use take 1 part of water to 1 part of stock solution. This is a slow acting developer. The temperature should not be allowed to fall below 60° F. (15° C.) as the developer becomes inert.

Metol

Water, warm	20 oz.	1000 c.c.
Metol	150 gr.	17 g
Sodium sulfite, anh	1.25 oz.	63 g
Sodium carbonate, anh	1.75 oz.	88 g
Potassium bromide	16 gr.	1.8 g

Always dissolve metol first.

For use dilute with equal part of water for portraiture; for landscape use two parts of water to one of stock solution. Gives detail without density except by prolonged development.

Metol-Hydroquinone

1

Note: Elon may be used with hydroquinone in place of metol, in equal quantity.

Solution A

Water	64 oz.	1820 c.c.
Metol	120 gr.	7.8 g
Hydroquinone	120 gr.	7.8 g
Sodium sulfite, anh	2 oz.	57 g

Solution B

Water	16 oz.	455 c.c.
Sodium carbonate, anh	2 oz.	57 g

For use take A, 4 oz.; B, 1 oz.; water, 4 oz.

2 (Eastman D-72)

For tray development of roll films and film packs and press work on fast orthochromatic and panchromatic films and plates.

Stock Solution

Water (about 125° F.) (52° C.)	16 oz.	500 c.c.
Elon	45 gr.	3.1 g
Sodium sulfite, anh	1½ oz.	45 g
Hydroquinone	175 gr.	12 g
Sodium carbonate, anh	2¼ oz.	67.5 g
Potassium bromide	27 gr.	1.9 g
Water to make	32 oz.	1 l

For general use take 1 part of stock solution to 2 parts of water. Develop for 4 to 6 minutes at 65° F. (18° C.) according to the con-

trast desired. For greater contrast, dilute 1:1 or use without dilution.

3 (Eastman D-61a)

For general tray or tank use.

Stock Solution

Water (125° F.) (52° C.)	16 oz.	500 g
Elon	45 gr.	3.1 g
Sodium sulfite, anh	3 oz.	90 g
Sodium bisulfite	30 gr.	2.1 g
Hydroquinone	85 gr.	5.9 g
Sodium carbonate, anh	165 gr.	11.5 g
Potassium bromide	24 gr.	1.7 g
Cold water to make	32 oz.	1 l

For tray use take 1 part of stock solution to 1 part of water. Develop for about 7 minutes at 65° F. (18° C.).

For tank use take 1 part of stock solution and 3 parts of water. At a temperature of 65° F. (18° C.), the development time is about 14 minutes. It is advisable to make up a greater quantity than is needed to fill the tank. If the developer in the tank is of normal strength, but the volume of solution has been reduced, add a sufficient quantity of the surplus solution to fill the tank.

If the strength of the solution, as well as the volume, has been reduced, add a sufficient quantity of the replenisher (formula below) to adjust the development time satisfactorily.

Replenisher Solution

Stock Solution A

Water (about 125° F.) (52° C.)	96 oz.	3 l
Elon	85 gr.	5.9 g
Sodium sulfite, anh	6 oz.	180 g
Sodium bisulfite	55 gr.	3.8 g
Hydroquinone	170 gr.	11.9 g
Potassium bromide	45 gr.	3.1 g
Cold water to make	1½ gal.	6 l

Stock Solution B

Sodium carbonate, anh	8 oz.	240 g
Water to make	64 oz.	2 l

For use take 3 parts of A and 1 part of B and add to the tank of developer as needed. Do not mix these solutions until ready for use.

Ortol

Solution A

Ortol	140 gr.	16 g
Potassium metabisulfite	70 gr.	8 g
Cold water	20 oz.	1000 c.c

Solution B

Sodium carbonate, anh	1.25 oz.	63 g
Sodium sulfite, anh	1.75 oz.	88 g
Potassium bromide	10–20 gr.	1.1–2.3 g
Water	20 oz.	1000 c.c.

For rapid developer take A, 1 part; B, 1 part. For slower, softer development take A, 1 part; B, 1 part; water, 1 part.

Paraminophenol

Water, boiling	20 oz.	1000 c.c.
Potassium metabisulfite	6 oz.	300 g
Paraminophenol	2 oz.	100 g

Add sodium or potassium hydroxide in small quantities to dissolve the precipitate first formed.

For use take 1 part stock solution with 20 parts water.

Pyro

1

Solution A

Water	16 oz.	455 c.c.
Oxalic acid	12 gr.	0.8 g
Pyrogallic acid	1 oz.	28 g

Solution B

Water	16 oz.	455 c.c.
Sodium sulfite, anh	2 oz.	57 g

Solution C

Water	16 oz.	455 c.c.
Sodium carbonate, anh	1 oz.	28 g

For immediate use mix 1 part each of A, B, and C with 10 parts of water.

2

Hurter and Driffield standard developer for plate testing:

Pyro	8 parts
Sodium sulfite, crystal	40 parts
Sodium carbonate, crystal	40 parts
Water to make	1000 parts

3 (Eastman D-1)

Stock Solution A

Sodium bisulfite	140 gr.	9.8 g
Pyro	2 oz.	60 g
Potassium bromide	16 gr.	1.1 g
Water to make	32 oz.	1 l

Stock Solution B

Water	32 oz.	1 l
Sodium sulfite, anh	3½ oz.	105 g

Stock Solution C

Water	32 oz.	1 l
Sodium carbonate, anh	2½ oz.	75 g

For tray development take 1 part of A, 1 part of B, 1 part of C, and 7 parts of water. Develop about 5 to 7 minutes at 65° F. (18° C.).

For tank development take 1 part of A, 1 part of B, 1 part of C, and 11 parts of water. Develop about 12 minutes at 65° F. (18° C.).

4 (Eastman D-90)

Stock Solution A

Sodium sulfite, anh	2 oz. 145	gr.	70 g
Sodium bisulfite	245	gr.	17 g
Pyro	290	gr.	20 g
Water to make	32	oz.	1 l

Stock Solution B

Sodium carbonate, anh	2½	oz.	75 g
Potassium bromide	15	gr.	1 g
Water to make	32	oz.	1 l

For average use take 1 part of stock solution A, 1 part of stock solution B, and 2 parts of water. Develop 4 to 6 minutes at 65° F. (18° C.). For greater contrast, use 1 part of A, 1 part of B, and 1 part of water; for less contrast, use 1 part of A, 1 part of B, and 4 parts of water.

Developers for Special Purposes

Tank Developers

1 Pyro

Water	48 oz.	1360 c.c.
Sodium sulfite, anh	115 gr.	7.5 g
Sodium carbonate, anh	90 gr.	5.8 g
Pyro	45 gr.	2.9 g

Dissolve immediately before use. Use full strength.
Develop 15 minutes at 65° F. (18° C.).

2 Pyro

Solution A

Water	16 oz.	455 c.c.
Oxalic acid	10 gr.	0.65 g
Pyro	1 oz.	28 g

Solution B

Water	16 oz.	455 c.c.
Sodium sulfite, anh	3 oz.	85 g

Solution C

Water	16 oz.	455 c.c.
Sodium carbonate, anh	1 oz.	28 g

For use take A, 1 part; B, 1 part; C, 1 part; water, 61 parts. Develop 30 minutes at 65° F. (18° C.) for best results.
For temperature 60° F. develop 35 minutes.
For temperature 65° F. develop 30 minutes.
For temperature 70° F. develop 25 minutes.

3 Pyro (Eastman D-79)

For negative motion picture film.

Water	2.5 qt.	750 c.c.
Sodium sulfite, anh	3.3 oz.	25 g
Pyro	145.8 gr.	2.5 g
Sodium carbonate, anh	291.6 gr.	5 g
Potassium bromide	29.2 gr.	0.5 g
Water to make	1 gal.	1 l

Time of development: 9 to 12 minutes at 65° F. (18° C.).

4 Elon-Hydroquinone-Pyro (Eastman D-75)

A long life deep tank developer for roll film.

Solution No. 1

Water (about 125° F.) (52° C.)	16 oz.	500 c.c.
Elon	44 gr.	3 g

Solution No. 2

Water (about 125° F.) (52° C.)	16 oz.	500 c.c.
Sodium sulfite, anh	260 gr.	18 g
Sodium bisulfite	1 oz. 85 gr.	36 g

Solution No. 3

Hot water (about 160° F.) (71° C.)	16 oz.	500 c.c.
Sodium sulfite, anh	260 gr.	18 g
Hydroquinone	175 gr.	12 g
Pyro	44 gr.	3 g

Solution No. 4

Water (about 125° F.) (52° C.)	16 oz.	500 c.c.
Sodium carbonate, anh	2 oz. 175 gr.	72 g

Mix each solution separately and add to the tank at once in the order given.

Then add water to make	1 gal.	4 l

Develop 7 to 14 minutes at 65° F. (18° C.), in the fresh developer according to the contrast desired. Greater or less contrast may be obtained by developing for longer or shorter times than those specified. Avoid the use of galvanized ware when mixing, or trouble from fog will be encountered. Cool the mixture of the first three solutions, before adding the cooled solution No. 4 to it, to avoid effervescence.

For small scale mixing, that is, less than 1 gallon (4 liters), all the chemicals may be dissolved in the order given in one-half the total volume of water (125° F.) (52° C.) and cold water added to make up to volume.

Replenisher Stock Solution

Water (about 125° F.) (52° C.)	64 oz.	2 l
Elon	½ oz.	15 g
Sodium sulfite, anh	3 oz.	90 g
Sodium bisulfite	3 oz.	90 g
Hydroquinone	1 oz.	30 g
Sodium carbonate, anh	8 oz.	240 g
Water to make	1 gal.	4 l

Dilute 1 part of stock solution with 1 part of water and add to the tank as required.

5 Glycin

Stock Solution

Hot water (200° F.)	60	oz.	1700 c.c.
Sodium carbonate, anh.	2	oz.	57 g
Glycin	0.5	oz.	14 g
Sodium sulfite, anh.	0.5	oz.	14 g

Dissolve in order. For use take stock solution, 6 parts; water, 58 parts.

For temperature 60° F. develop 30 minutes.
For temperature 65° F. develop 25 minutes.
For temperature 70° F. develop 20 minutes.

6 Glycin (Eastman D-78)

Water	2.5	qt.	750 c.c.
Sodium sulfite, anh.	175	gr.	3 g
Glycin	175	gr.	3 g
Sodium carbonate, anh.	350	gr.	6 g
Water to make	1	gal.	1 l

Time of development: 15 to 25 minutes at 65° F. (18° C.).

FINE GRAIN DEVELOPERS

1 An Automatic System of Development for Fine Grain

This is done by the use of two solutions as follows:

A

Water	1 qt.
Metol	95 gr.
Sulfite of soda, anh.	750 gr.
Hydroquinone	95 gr.

B

Saturated solution of borax

To mix solution A take one-half of the water, add the metol and, when dissolved, add one-half of the sulfite. To the other half of the water, hot, add the rest of the sulfite and, when dissolved, add the hydroquinone. Cool and add this second solution to the first, making solution A.

To use pour enough of solution A into a tray to well cover the film or plate, add drops of saturated solution of potassium bromide, enough for the kind of material in use. Some do not require any, others do. Use only enough to keep the whites clear. Soak the film or plate in the A solution for at least two minutes, drain but do not rinse, and then soak in solution B for at least two minutes. Rinse, fix and wash as usual. If a tank is used, the time in each solution must be at least two minutes after the tank is filled. It is necessary to give a full exposure as the high lights cannot be over developed and the shadows will go as far as the exposure will permit. This system gives a gamma of about 0.7 and will be found to produce a very fine negative for enlarging. It is especially good for work in microscopic photography.

These solutions are very concentrated and must not be allowed to go below 60° F. They can be used repeatedly and keep well. Results are best at about 70° F., but it makes very little difference between 65° and 80° F.

2 Elon-Hydroquinone-Borax (Eastman D-76)

For low contrast and greatest shadow detail on panchromatic films and plates.

Water (about 125° F.) (52° C.)	96	oz.	3 l
Elon	116	gr.	8 g
Sodium sulfite, anh.	13¼	oz.	400 g
Hydroquinone	290	gr.	20 g
*Borax	116	gr.	8 g
Water to make	1	gal.	4 l

*Such as 20-Mule Team Borax.

Use without dilution. For tank use, develop 15 to 25 minutes at 65° F. (18° C.) in the fresh developer according to the contrast desired; for tray use, decrease the time about 20 %. A faster working developer can be obtained by increasing the quantity of borax.

Still finer grained results may be secured by adding potassium bromide to the developer. The maximum quantity which may be added without too great a loss of speed is 300 grains per gallon (20 grams per 4 liters). As bromide is added, it will be necessary to increase both the time of development and the exposure for best results.

Replenisher Solution

Water (about 125° F.) (52° C.)	96	oz.	3 l
Elon	175	gr.	12 g
Sodium sulfite, anh.	13¼	oz.	400 g
Hydroquinone	1	oz.	30 g
*Borax	2 oz. 290	gr.	80 g
Water to make	1	gal.	4 l

*Such as 20-Mule Team Borax.

Use the replenisher without dilution and add to the tank to maintain the level of the solution.

3 Paraphenylene Diamine

Paraphenylene diamine	10 g
Sodium sulfite, anh.	60 g
Tribasic sodium phosphate (10 %)	20 c.c.
Potassium bromide (10 %)	10 c.c.
Water	1000 c.c.

Develop one hour at 65° F.

CONTRAST DEVELOPERS

1 Developer of Line Work (Black and White)

Also for lantern slides, or wherever increased contrast is desired.

A

Distilled water	32 oz.
Hydroquinone	1½ oz.
Sodium sulfite, anh.	1 oz.
Sulfuric acid (conc.)	60 min.

B

Distilled water	32 oz.
Sodium carbonate, anh.	1 oz.
Potassium carbonate, anh.	3 oz.
Potassium bromide	130 gr.
Sodium sulfite, anh.	3 oz.

For tray or tank development, use equal parts of A and B without further dilution. Develop at 65° F. for 5 to 10 minutes according to exposure or density desired.

2 Contrast Developer for Photomicrography

Water (52° C.)	16	oz.	500 c.c.
Elon	14	gr.	1 g
Sodium sulfite	2½	oz.	75 g
Hydroquinone	130	gr.	9 g
Sodium carbonate	360	gr.	25 g
Potassium bromide	70	gr.	5 g
Water to make	32	oz.	1 l

3 Process Tray Developer

Hydroquinone-Caustic Soda (Eastman D-9)

Stock Solution A

Water (about 125° F.) (52° C.)	16	oz.	500 c.c.
Sodium bisulfite	¾	oz.	22.5 g
Hydroquinone	¾	oz.	22.5 g
Potassium bromide	¾	oz.	22.5 g
Cold water to make	32	oz.	1 l

Stock Solution B

Cold water	32	oz.	1 l
Sodium hydroxide (caustic soda)	1¾	oz.	52.5 g

Use equal parts of A and B and develop not more than two minutes at 65° F. (18° C.). Wash thoroughly after development and before fixing, otherwise stains and dichroic fog will result. Development slows up greatly below 55° F. (13° C.).

Cold water should always be used when dissolving sodium hydroxide (caustic soda) because considerable heat is evolved. If hot water is used, the solution will boil with explosive violence and may cause serious burns if the hot alkali spatters on the hands or face. Solution A should be stirred thoroughly when the caustic alkali is added to it; otherwise the heavy caustic solution will sink to the bottom.

4 Process Tank or Tray Developer

Elon-Hydroquinone (Eastman-D-11)

Water (about 125° F.) (52° C.)	16	oz.	500 c.c.
Elon	15	gr.	1 g
Sodium sulfite, anh	2½	oz.	75 g
Hydroquinone	130	gr.	9 g
Sodium carbonate, anh	365	gr.	25 g
Potassium bromide	73	gr.	5 g
Cold water to make	32	oz.	1 l

This formula used at 65° F. (18° C.), in either tank or tray, will give very good contrast in five minutes. The developer is recommended for use with Process and Process Panchromatic films or plates.

When less contrast is desired, the developer should be diluted with an equal volume of water.

Maximum Energy Developer

For High Speed Films or Plates (Eastman D-82)

Water (about 125° F.) (52° C.)	24	oz.	750	c.c.
Wood alcohol	1½	oz.	48	c.c.
Elon	200	gr.	14	g
Sodium sulfite, anh	1¾	oz.	52.5	g
Hydroquinone	200	gr.	14	g
Sodium hydroxide (caustic soda)	125	gr.	8.8	g
Potassium bromide	125	gr.	8.8	g
Cold water to make	32	oz.	1	l

Develop about four to five minutes at 65° F. (18° C.).

The prepared developer does not keep more than a few days. If wood alcohol is not added and the developer is diluted, the solution is not so active as in the concentrated form. This developer gives the greatest possible density with negatives having a minimum exposure.

X-ray Film Developer

Elon-Hydroquinone (Eastman D-19b)

Water (about 125° F.) (52° C.)	16 oz.		500	c.c.
Elon	32 gr.		2.2	g
Sodium sulfite, anh	2 oz.	175 gr.	72	g
Hydroquinone	128 gr.		8.8	g
Sodium carbonate, anh	1 oz.	265 gr.	48	g
Potassium bromide	60 gr.		4	g
Cold water to make	32 oz.		1	l

Use without dilution. Develop for 5 minutes at 65° F. (18° C.).

Developer for Lantern Slides

1 For Blue Black Tones (Eastman D-34)

Stock Solution A

Water (about 125° F.) (52° C.)	16	oz.	500	c.c.
Elon	60	gr.	4.2	g
Sodium sulfite, anh	½	oz.	15	g
Hydroquinone	½	oz.	15	g
Cold water to make	32	oz.	1	l

Stock Solution B

Water	32	oz.	1	l
Sodium carbonate, anh	½	oz.	15	g
Potassium bromide	30	gr.	2.1	g

For use, take equal parts of A and B.

For softer tones, dilute with an equal volume of water.

Develop 1½ to 3 minutes at 70° F. (21° C.).

2 For Warm Black Tones (Eastman D-32)

Stock Solution A

Water (about 125° F.) (52° C.)	16	oz.	500	c.c.
Sodium sulfite, anh	90	gr.	6.3	g
Hydroquinone	100	gr.	7	g
Potassium bromide	50	gr.	3.5	g
Citric acid	10	gr.	0.7	g
Cold water to make	32	oz.	1	l

Stock Solution B

Cold water	32 oz.	1 l
Sodium carbonate, anh	1 oz.	30 g
Sodium hydroxide (caustic soda)	60 gr.	4.2 g

For use, take 1 part of A and 1 part of B. For still warmer tones, 1 part of A and 2 parts of B.

Develop about 4 to 6 minutes at 70° F. (21° C.).

DEVELOPERS FOR PAPERS

Metol-Hydroquinone

1 For Ordinary Contact Printing Paper

Water	16 oz.	455 c.c.
Metol	18 gr.	1.2 g
Hydroquinone	18 gr.	1.2 g
Sodium sulfite, anh	204 gr.	13 g
Sodium carbonate, anh	408 gr.	26 g
Potassium bromide	10 gr.	0.6 g

If the whites fail to develop without fog, 10 % potassium bromide solution may be added, a few drops at a time, until the desired results are obtained.

2 For Ordinary Contact Printing Paper

Water (soft or distilled)	40 oz.	1000 c.c.
Metol	15 gr.	1 g
Sodium sulfite, anh	1 oz.	28 g
Hydroquinone	60 gr.	4 g
Sodium carbonate, anh	¾ oz.	21 g
Potassium bromide (10 % solution)	40 min.	40 min.

3 Universal Paper Developer

For Contact Prints and Enlargements (Eastman D-72)

Stock Solution

Water (about 125° F.) (52° C.)	16 oz.	500 c.c.
Elon	45 gr.	3.1 g
Sodium sulfite, anh	1½ oz.	45 g
Hydroquinone	175 gr.	12 g
Sodium carbonate, anh	2¼ oz.	67.5 g
Potassium bromide	27 gr.	1.9 g
Cold water to make	32 oz.	1 l

For fast chloride papers such as Velox: stock solution 1 part, water 1 part. Develop 45 seconds at 70° F. (21° C.).

For chloride papers such as Azo: stock solution 1 part, water 2 parts. Develop 45 seconds at 70° F. (21° C.).

For bromide papers: stock solution 1 part, water 4 parts. Develop not less than 1½ minutes at 70° F. (21° C.).

4 Portrait Paper Developer (Eastman D-52)

Stock Solution

Water (about 125° F.) (52° C.)	16 oz.	500 c.c.
Elon	22 gr.	1.5 g
Sodium sulfite, anh	¾ oz.	22.5 g
Hydroquinone	90 gr.	6.3 g
Sodium carbonate, anh	½ oz.	15 g
Cold water to make	32 oz.	1 l

For professional contact papers such as Vitava Athena, use stock solution 1 part, water 1 part. To each 32 ounces (1 liter) of this developer, add ¼ ounce (8 c.c.) of a 10 % potassium bromide solution.

For professional enlarging papers and bromide papers, use full strength stock solution. To each 32 ounces (1 liter) of developer add ½ ounce (16 c.c.) of 10 % potassium bromide solution.

Develop all papers not less than 1½ minutes at 70° F. (21° C.).

Note: More bromide may be added if warmer tones are desired.

Amidol

Developer for Bromide Papers (Eastman D-51)

Stock Solution

Water (about 125° F.) (52° C.)	24 oz.	750 c.c.
Sodium sulfite, anh	4 oz.	120 g
Di-aminophenol hydrochloride (amidol)	1¼ oz.	37.5 g
Cold water to make	32 oz.	1 l

For use, take 6 ounces (180 c.c.) stock solution, ¾ dram (3 c.c.) 10 % potassium bromide solution, and 24 ounces (750 c.c.) of water. This developer oxidizes rapidly when exposed to the air so that only a quantity sufficient for immediate use should be mixed.

UNIVERSAL DEVELOPER

The following developer will give excellent results for plates, films, lantern slides, bromide paper or gaslight paper. It should be dissolved immediately before using, since it keeps only a few hours in solution.

Amidol	25 gr.	1.6 g
Sodium sulfite	120 gr.	7.8 g
Water	10 oz.	300 c.c.

For lantern slides, bromide paper or gaslight papers add to the above,

Potassium bromide	7 gr.	0.5 g

The concentration given is satisfactory for any of the purposes mentioned. Develop three to five minutes at a temperature of 65° F. or 18° C.

RINSING AND HARDENING BATHS

Rinsing Bath or Short Stop

After development rinse prints (or negatives) for five seconds before fixing.

Water	32 oz.	10 l
Acetic acid (glacial)	0.5 oz.	6 c.c.

Hardening Bath

For Films or Plates (Eastman SB-3)

In hot weather, the following hardening bath should be used after development and before fixation in conjunction with fixing baths which do not harden sufficiently:

Water	32 oz.	1 l
Potassium chrome alum	1 oz.	30 g

Agitate the negatives for a few seconds when first immersed in hardener. Leave them in the bath for three minutes. This bath should be renewed frequently.

FIXING BATHS

Plain Non-hardening Fixing Bath

Water	32 oz.	852 c.c.
Hypo (sodium thiosulfate)	8 oz.	227 g

Do not use the bath when it is discolored; it must be made fresh each day.

Chrome Alum for Plates or Films

A

Water	128 oz.	3600 c.c.
Hypo (sodium thiosulfate)	32 oz.	850 g

B

Water	32 oz.	852 c.c.
Sodium sulfite, anh	3 oz.	85 g
Sulfuric acid, C. P.	0.5 oz.	14 c.c.
Chrome alum, anh	2 oz.	56 g

Note: Be sure to mix solution B exactly in given proportions and rotation.

Always pour B into A while stirring well. If this is not done, precipitation will take place.

During the cold season one half the quantity of solution B is sufficient for full quantity of solution A.

This bath remains clear after frequent use, does not discolor the negatives and hardens the film to such a degree that the negatives can be washed in warm water and dried by artificial heat if necessary. They should be left in the bath ten to twenty minutes after the bromide of silver appears to have been dissolved, to insure permanency, freedom from stain and perfect hardening.

It is not advisable to use this bath, which contains sulfuric acid, in metal developing tanks.

Acid Hardening Fixing Bath

For Films and Plates (Eastman F-5)

Water (about 125° F.) (52° C.)	20 oz.	600 c.c.
Sodium thiosulfate (hypo)	8 oz.	240 g
Sodium sulfite, anh	$\frac{1}{2}$ oz.	15 g
*Acetic acid (28 % pure)	$1\frac{1}{2}$ oz. fl.	47 c.c.
**Boric acid, crystals	$\frac{1}{4}$ oz.	7.5 g
Potassium alum	$\frac{1}{2}$ oz.	15 g
Cold water to make	32 oz.	1 l

* To make 28 % acetic acid from glacial acetic acid, dilute three parts of glacial acetic acid with eight parts of water.

** Crystalline boric acid should be used as specified. Powdered boric acid dissolves only with great difficulty, and its use should be avoided.

Dissolve the hypo in about one-half the required volume of water (about 125° F.) (52° C.) and then add the remaining chemicals in the order given, taking care that each chemical is dissolved before adding the next. Then dilute with water to the required volume.

Non-hardening Fixing Bath (Eastman F-24)

Water (about 125° F.) (52° C.)	16 oz.	500 c.c.
Sodium thiosulfate (hypo)	8 oz.	240 g
Sodium sulfite, anh	145 gr.	10 g
Sodium bisulfite	365 gr.	25 g
Cold water to make	32 oz.	1 l

This bath is recommended for films, plates or paper when no hardening is desired.

Acid Fixing Bath for Papers

(May also be used for plates or films)

Water	64 oz.
Hypo	16 oz.

Dissolve, then add the following acid hardener:

Water	5 oz.
Sodium sulfite, anh	$\frac{1}{2}$ oz.
Acetic acid, 25 %	3 oz.
Alum, anh	$\frac{1}{2}$ oz.

This fixing bath is also excellent for dry plates and films, and will keep indefinitely before using; therefore it can be made up some time in advance. One pint of the bath should fix at least fifty 4 × 5 prints. The acid fixing bath can be used repeatedly. It keeps with but little care. It will by degrees become alkaline by the gradual addition of developer adhering to the prints. It should be discarded entirely when it becomes frothy, and a fresh bath prepared.

INTENSIFIERS

Mercury

1

Prepare the following solution, which will keep and work well until exhausted.

Solution No. 1

Water	16 oz.	455 c.c.
Mercuric chloride, $HgCl_2$	120 gr.	7.8 g
Potassium bromide	120 gr.	7.8 g

Solution No. 2

Number 2 should be mixed fresh.

Water	8 oz.	227 c.c.
Sodium sulfite, anh	1 oz.	28 g

After the negative is well fixed and washed, immerse in No. 1 until it has become thoroughly whitened, and after rinsing carefully, place it in No. 2, leaving it there until entirely cleared. In case sufficient intensification has not been gained, wash for ten minutes, repeat the operation and finally wash well. If after intensification the negative is too dense it may be reduced by placing it for a few seconds in water 16 oz., hypo 1 oz.

If the negative has not been thoroughly fixed and washed before intensification, stains will ensue.

2

Mercuric chloride, $HgCl_2$, 2 % solution	100 c.c.
Potassium iodide, KI, 10 % solution	25 c.c.
Sodium thiosulfate (hypo), 10 % solution	40 c.c.
Water	300 c.c.

Part of the mercury solution is added to the water and then part of the iodide solution, continuing until all the mercury and iodide have been added to the water.

When the solution is clear, add the hypo.

Use the complete solution at full strength.

Chromium

(Eastman In-4)

Stock Solution

Potassium bichromate	3 oz.	90 g
Hydrochloric acid, C. P.	2 oz. fl.	64 c.c.
Water to make	32 oz.	1 l

For use, take 1 part of stock solution to 10 parts of water. Bleach thoroughly, then wash five minutes and re-develop fully (about 5 minutes) in artificial light or daylight in any quick-acting, non-staining developer containing the normal proportion of bromide. Then wash thoroughly and dry. Greater intensification can be secured by repeating the process. The degree of intensification can be controlled by varying the time of re-development.

REDUCERS

1 Farmer's Reducer

A

Water	16 oz.	455 c.c.
Hypo (sodium thiosulfate)	1 oz.	28 g

B

Water	16 oz.	455 c.c.
Potassium ferricyanide	1 oz.	28 g

As this solution is affected by light, the bottle containing it should be of amber color or wrapped in opaque paper and kept in the dark when not in use.

Mix for immediate use:

A	8 parts
B	1 part

Use in subdued daylight.

The negative can be placed in this solution directly after fixing. If a dry negative is to be reduced, it must be soaked in water for at least half an hour before applying the solution. To avoid streaks, always rinse the negative before holding it up for examination. As soon as sufficiently reduced wash thoroughly.

2 Proportional Reducer (Eastman R-5)

Stock Solution A

Water	32 oz.	1 l
Potassium permanganate	4 gr.	0.3 g
Sulfuric acid (10 % solution)	½ oz. fl.	16 c.c.

Stock Solution B

Water	96	oz.	3	l
Ammonium persulfate	3	oz.	90	g

For use, take one part of A to three parts of B. When sufficient reduction is secured the negative should be cleared in a 1 % solution of sodium bisulfite. Wash the negative thoroughly before drying.

STAIN REMOVERS

1 Iron Clearing Solution

To remove yellow stain caused by pyro or hydroquinone developer, wash well to free from hypo and place in

Water	20 oz.	568 c.c.
Ferrous sulfate, pure	3 oz.	85 g
Sulfuric acid, C. P	1 oz.	28 g
Powdered alum	1 oz.	28 g

until stain is gone, then wash well.

2 (Eastman S-6)

Developer or oxidation stain may be removed by first hardening the film for 2 or 3 minutes in a 5 % formalin solution, then washing for 5 minutes and bleaching in:

Stock Solution A

Potassium permanganate	75	gr.	5.3	g
Water to make	32	oz.	1	l

Stock Solution B

Sodium chloride (table salt)	$2\frac{1}{2}$	oz.	75	g
Sulfuric acid, C. P	$\frac{1}{2}$	oz. fl.	16	c.c.
Water to make	32	oz.	1	l

Use equal parts of A and B. The solutions should not be mixed until ready for immediate use since they do not keep long after mixing. All particles of permanganate should be dissolved completely when preparing solution A, since undissolved particles are likely to produce spots on the negative. Bleaching should be complete in 3 or 4 minutes at 65° F. (18° C.). The brown stain of manganese dioxde formed in the bleaching bath is best removed by immersing the negative in a 1 % sodium bisulfite solution. Then rinse well and develop in strong light with any non-staining developer.

Warning: Developers containing high sulfite and low alkali should not be used for re-development, because the sulfite tends to dissolve the silver image before the developer can act upon it.

BLUE PRINT PAPER, FORMULAE FOR SENSITIZING

1

Solution A

Water	8.5 oz.	50 c.c.
Iron and ammonium citrate	1.7 oz.	10 g

Solution B

Water	8.5 oz.	50 c.c.
Potassium ferricyanide	1.4 oz.	8 g

Filter separately. The solutions, which may be preserved separately for some time, are best kept in the dark. For use, mix, in a dark room or by an artificial light of low intensity, equal quantities of the two solutions.

Any non-absorbent paper may be sensitized by brushing the solution over it rapidly with a soft, wide, flat brush, going over the surface twice, the second coat being applied in a direction at right angles to the first. An alternative method is to lower the paper, beginning at one edge, on to the surface of the solution in a tray and allow it to float for a few seconds. Care must be taken to exclude air bubbles. After sensitizing by either method, the paper should be hung by one edge in a dark room to dry.

2

Blue printing depends to a large extent upon surface of paper. The following formula is recommended as producing clear whites:

Solution 1

Potassium ferricyanide, $K_3Fe(CN)_6$	10 g
Distilled water	100 c.c.

Solution 2

Iron and ammonium citrate (ferric)	30 g
Water	100 c.c.
Gum arabic (gum acacia)	5 g

Equal parts of the above solutions are mixed just before use. The paper to be sensitized may be floated on the surface or the liquid may be applied with a tuft of absorbent cotton using cross strokes to insure an even coating. The sensitized paper must be dried in the dark and should be used within 36 hours.

ULTRAVIOLET SENSITIZATION

Photographic plates can be made sensitive to short-wave ultraviolet light by immersion in a dilute solution of citric acid in 95 % ethyl alcohol (1 % citric acid). (Sodium salicylate may be substituted for the citric acid.) The plate is immersed in the citric acid solution and immediately withdrawn and dried in less than one minute by waving in the air before putting in the holder. After exposure the plate can be developed without previous washing and without special precautions. The coating of citric acid adheres to the plate so that a number of plates may be treated and stored away for future use. Citric acid has no detrimental action on the emulsion or the developer. The sharpness of the image is not diminished.

FACTORIAL DEVELOPMENT

If the image first appears after immersion in the developer for a certain time, then this period of time multiplied by the "factor" for the particular developer used will give the total time required for full, normal development. The factor for the degree of development desired may well be determined by experiment; the following are suggested:

Amidol, 2 gr. per oz.	18
Glycin	8–12
Hydroquinone	$4\frac{1}{2}$–5
Metol	30
Metol-hydroquinone	14
Ortol	10

Pyro, without bromide:

1 gr. per oz	18
2 gr. per oz	12
3 gr. per oz	10
4 gr. per oz	8
5 gr. per oz	6

With 1 part bromide to 4 parts pyro:

1 gr. pyro per oz	9
2 gr. pyro per oz	5
3 gr. pyro per oz	4½
4 gr. pyro per oz	4

PLATE AND FILM SPEEDS

Compiled by Chas. H. Shipman

It is pertinent to state that there is at present no exact way to indicate plate and film speeds. Also since different manufacturers do not use identical methods in their speed determinations the stated speeds vary among the different makes.

In 1900 two English amateurs, Messrs. Hurter and Driffield, proposed a system of plate speeds based on the assumption that, if a plate is given a series of graded exposures, and developed in a pyro developer free from bromide, a density-log exposure curve may be plotted from which a speed value may be determined which is supposed to be inversely proportional to the exposure required to produce average density. The Scheiner system is based upon the assumption that speeds are inversely proportional to the exposure necessary to produce a just visible image. It will be evident that these two systems cannot be compared exactly. Nor is either system correct since the assumptions upon which they are based are not exactly true. Nevertheless the results obtained by these methods are well within the latitude of the emulsions and will serve well as a starting point for all ordinary work. The exposures may be easily altered after a trial to produce the type of result desired.

In general, emulsions under 18 American Scheiner (400 H & D) are considered slow and are used for work requiring contrast, or for copying and commercial work. Those from 18 to 21 American Scheiner (400 to 800 H & D) are of average speed and are used for general portrait, commercial and amateur work. Those over 21 American Scheiner (800 H & D) are for special work requiring extreme speed. They should be used only when necessary as they have small latitude and are not of as fine grain as the slower emulsions.

COMPARISON OF PLATE SPEEDS

The table below gives the approximate values of the different speed systems used here and abroad as compared with each other. No exact values can be given due to the variation in manufacturers' methods of getting their speed ratings.

Scheiner American	Scheiner European	Din	Weston	H & D American	H & D European	Relative Exposure
8		1/10	0.75	35		32
9		2/10	1	45		27

CROSS-SECTION AND MASS OF WIRES

U. S. Measure

Diameters are given in mils (1 mil = .001 in.), and area in square mils (1 sq. mil = .000001 sq. in.). For sections and masses for one-tenth the diameters given, divide by 100 and for sections and masses for ten times the diameter multiply by 100.

CROSS-SECTION AND MASS OF WIRES (Continued)

Metric Measure

Diameters are given in thousandths of a centimeter and area of section in square thousandths of a centimeter. 1 $(cm/1000)^2$ = .000001 sq. cm For sections and masses for diameters 1/10 or 10 times those of the table, divide or multiply by 100.

RESISTANCE OF WIRES

The following table gives the approximate resistance of various metallic conductors. The values have been computed from the resistivities at 20°C, except as otherwise stated, and for the dimensions of wire indicated. Owing to differences in purity in the case of elements and of composition in alloys, the values can be considered only as approximations.

The following dimensions have been adopted in the computations.

B. & S. gauge	Diameter		B. & S. gauge	Diameter	
	mm	mils 1 mil = .001 in.		mm	mils 1 mil = .001 in.

APPROXIMATE CORRECTION FOR REFRACTION

For Astronomical Observations

Corresponding to temperature of 50° F., and to a barometric pressure of 29.6 inches.

(From Young's General Astronomy, by permission.)

Altitude.	Refraction.		Altitude.	Refraction.		Altitude.	Refraction.	
°	′	″	°	′	″	°	′	″
0	34	50	11	4	47.7	30	1	39.5
1	24	22	12	4	24.5	35	1	22.1
2	18	06	13	4	04.4	40	1	08.6
3	14	13	14	3	47.0	45		57.6
4	11	37	16	3	18.2	50		48.3
5	9	45	18	2	55.5	55		40.3
6	8	23	20	2	37.0	60		33.2
7	7	19	22	2	21.6	65		26.8
8	6	29	24	2	08.6	70		20.9
9	5	49	26	1	57.6	80		10.2
10	5	16	28	1	48.0	90		0.0

For every 5° F. by which the temperature is less than 50° F., add one per cent to the tabular refraction, and decrease it in the same ratio for temperatures above 50° F.

Increase the tabular refraction by three and a half per cent for every inch of barometric pressure above 29.6 inches, and decrease it in the same ratio below that point. These corrections for temperature and pressure, though only approximate, will give a result correct within 2″ except in extreme cases.

DATA IN REGARD TO THE EARTH

(Radius, U. S. C. & G. Survey.)

Equatorial radius, 6,378,388 meters, 3,963.399 miles.

Polar radius, 6,356,909 meters, 3,949.992 miles.

1° latitude at the equator = 68.70 miles.

1° latitude at the pole = 69.41 miles.

Mean density of the earth, 5.52 g/cm³ or 344.6 lb./ft.³.

Approximate mass of the earth, 6×10^{21} tons or 5.4×10^{24} kg.

Mean distance to the sun, 149,500,000 km or 92,900,000 mi.

Mean distance to the moon, 384,393 km or 238,854 mi.

DATA CONCERNING THE SOLAR SYSTEM

(Values from Young's General Astronomy, by permission.)

Name.	Mean dis. from sun, millions of miles.	Period in years.	Mean dia. in miles.	Mass, the earth = 1.	Mean density, water = 1
Mercury.....	36.0	0.24	3030	0.047	4.70
Venus........	67.2	0.62	7700	0.82	4.94
The earth....	92.9	1.00	7917.6	1.000	5.55
Mars........	141.5	1.88	4230	0.107	3.92
Jupiter.......	483.3	11.86	86500	317.7	1.32
Saturn.......	886.0	29.46	73000	94.8	0.72

METEOROLOGICAL DATA

The Atmosphere

Total mass, estimated by Elkholm:
5.2×10^{21} grams.
11.4×10^{18} pounds.
Composition:
The total volume = 1.

Substance.	Elevation.		
	Sea level.	10000 meters.	50000 meters.
Argon	0.009	0.006	0.0003
Carbon dioxide	0.0003	0.00015	0.0000
Helium	0.0000015	0.0000	0 00126
Hydrogen	0.0001	0.00035	0.136
Neon	0.000015	0.00002	0.0000
Nitrogen	0.780	0.812	0.792
Oxygen	0.210	0.182	0.070

Atmospheric Potential

The potential of the atmosphere increases with the elevation 130 to 200 volts per meter.

Velocity of Seismic Waves in the Earth's Crust

Longitudinal	4 to 14 kilometers per sec.
Transverse	3 to 10 kilometers per sec.

Angular Radius of Halos and Rainbows

Coronæ due to small water drops	1° to 10°
Small halo, due to 60° angles of ice crystals	22°
Large halo, due to 90° angles of ice crystals	46°
Rainbow, primary	41° 20′
Rainbow, secondary	52° 15′

Solar Constant

The energy falling on one sq.cm. area at normal incidence equals 1.92 small calories per minute.

PROBABLE VALUES OF THE GENERAL PHYSICAL CONSTANTS

Raymond T. Birge: The Physical Review Supplement, Vol. 1, No. 1, July, 1929.

Table A. Principal Constants and Ratios

Velocity of light	$c = (2.99796 \pm 0.00004) \times 10^{10}$ cm · sec^{-1}
Gravitation constant	$G = (6.664 \pm 0.002) \times 10^{-8}$ dyne · cm^2 · g^{-2}
Liter	$l = 1000.027 \pm 0.001$ cm^3
Volume of perfect gas (0°C, A_n)	$v_n = (22.4141 \pm 0.0008) \times 10^3$ cm^3 · mole^{-1}
Volume of perfect gas (0°C, A_{45})	$R = 22.4146 \pm 0.0008$ liter · mole^{-1}
International ohm = p abs-ohm	$p = 1.00051 \pm 0.00002$
International ampere = q abs-amp	$q = 0.99995 \pm 0.00005$
Atomic weights	O = 16.0000; H = 1.00777 ± 0.00002
	He = 4.0022 ± 0.0004; N = 14.0083 ± 0.0008
	Ag = 107.880 ± 0.001; I = 126.932 ± 0.002
	C = 12.003 ± 0.001; Ca = 40.075 ± 0.005
Normal atmosphere	$A_n = (1.013249 \pm 0.000003) \times 10^6$ dyne · cm^{-2}
45° atmosphere	$A_{45} = (1.013199 \pm 0.000003) \times 10^6$ dyne · cm^{-2}
Ice point (absolute scale)	$T_0 = 273.18 \pm 0.03$°K
Mechanical equivalent of heat	$J_{15} = 4.1852 \pm 0.0006$ abs-joule · cal$_{15}^{-1}$
Electrical equivalent of heat	$J'_{15} = 4.1835 \pm 0.0007$ int-joule · cal$_{15}^{-1}$
Faraday constant	$F = 96494 \pm 5$ int-coul · g-equiv^{-1}
	$= 96489 \pm 7$ abs-coul · g-equiv^{-1}
	$= 9648.9 \pm 0.7$ abs-em-unit · g-equiv^{-1}
	$Fc = (2.8927_0 \pm 0.0002) \times 10^{14}$ abs-es-unit · g-equiv^{-1}
Electronic charge	$e = (4.770 \pm 0.005) \times 10^{-10}$ abs-es-units
	$e/c = (1.5910_5 \pm 0.0016) \times 10^{-20}$ abs-em-units
Specific electronic charge (spectroscopic)	$e/m = (1.761 \pm 0.001) \times 10^7$ abs-em-unit · g^{-1}
	$(e/m)c = (5.279_{41} \pm 0.003) \times 10^{17}$ abs-es-unit · g^{-1}
Specific electronic charge (deflection)	$e/m = (1.769 \pm 0.002) \times 10^7$ abs-em-unit · g^{-1}
	$(e/m)c = (5.303_{39} \pm 0.006) \times 10^{17}$ abs-es-unit · g^{-1}
Planck constant	$h = (6.547 \pm 0.008) \times 10^{-27}$ erg · sec

PROBABLE VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Table B. Additional Quantities Evaluated or Used in Connection with Table A

Ratio of *es* to *em* units (direct)	c'	$= (2.9979 \pm 0.0001) \times 10^{10}$ cm · sec^{-1}
Acceleration of gravity (45°)	g_{45}	$= 980.616$ cm · sec^{-2}
Acceleration of gravity (normal)	g_n	$= 980.665$ cm · sec^{-2}
Maximum density of water	$\delta_m(H_2O)$	$= 0.999973 \pm 0.000001$ g · cm^{-3}
Density of oxygen gas (0°C, A_{45})	$L(O_2)$	$= 1.428965 \pm 0.000030$ g · liter^{-1}
Factor converting oxygen (0°C, A_{45}) to ideal gas	$1 - \alpha(O_2)$	$= 1.000927 \pm 0.000030$
Density of nitrogen (0°C, A_{45})	$L(N_2)$	$= 1.25046 \pm 0.000045$ g · liter^{-1}
Factor converting nitrogen (0°C, A_{45}) to ideal gas	$1 - \alpha(N_2)$	$= 1.00043 \pm 0.00002$
Density of Hg (0°C, A_n)	D_n	$= 13.59509 \pm 0.00003$ g · cm^{-3}
International volt (= pq abs-volts)	pq	$= 1.00046 \pm 0.00005$
International joule (= pq^2 abs-joules)	pq^2	$= 1.00041 \pm 0.00010$
Electrochemical equivalent of Ag	$E(Ag)$	$= (1.11800 \pm 0.00005) \times 10^{-3}$ g · int-coul^{-1}
		$= (1.11805) \pm 0.00007) \times 10^{-3}$ g · abs-coul^{-1}
Density of calcite (20°C)	ρ	$= 2.7102 \pm 0.0004$ g · cm^{-3}
Structural constant of calcite (20°C)	$\phi(\beta)$	$= 1.09630 \pm 0.00007$
Rydberg constant for hydrogen	R_H	$= 109677.759 \pm 0.05$ cm^{-1}
Rydberg constant for ionized helium	R_{He}	$= 109722.403 \pm 0.05$ cm^{-1}
Wave-length of red Cd line (15°C, A_n)	λ_{Cd}	$= 6438.4696$ I.Å.(definition of I.Å. unit)
Rydberg constant for infinite mass	R_∞	$= 109737.42 \pm 0.06$ cm^{-1}
	cR_∞	$= (3.28988 \pm 0.00004) \times 10^{15}$ sec^{-1}
True grating space of calcite (20°C)	d'_{20}	$= (3.0283 \pm 0.0010) \times 10^{-8}$ cm
Effective grating space of calcite (20°C)	d_{20}	$= (3.0279 \pm 0.0010) \times 10^{-8}$ cm
Avogadro's number	$N_0 = Fc/e$	$= (6.064_{36} \pm 0.006) \times 10^{23}$ mole^{-1}
Gas constant per mole	$R_0 = \nu_n A_n / T_0$	$= (8.3136_0 \pm 0.0010) \times 10^7$ erg · degree^{-1} · mole^{-1}
	$R_0' = R_0/(J_{15} \times 10^7)$	$= 1.9864_3 \pm 0.0004$ cal$_{15}$ · deg^{-1} · mole^{-1}
Boltzmann constant	$k = R_0/N_0$	$= (1.3708_9 \pm 0.0014) \times 10^{-16}$ erg · deg^{-1}
Second radiation constant (exp. value)	c_2	$= 1.432 \pm 0.003$ cm · deg.
Second radiation constant (indirect)	$c_2 = hc/k$	$= 1.4317_4 \pm 0.0006$ cm · deg.
Stefan-Boltzmann constant (exp. value)	σ	$= (5.735 \pm 0.011) \times 10^{-5}$ erg · cm^{-2} · deg^{-4} · sec^{-1}
Stefan-Boltzmann constant (indirect)	$\sigma = 2\pi^5 k^4 / 15c^2h^3$	$= (5.713_9 \pm 0.006) \times 10^{-5}$ erg · cm^{-2} · deg^{-4} · sec^{-1}

Table C. Miscellaneous Derived Constants

Mass of electron (spectroscopic)	$m_0 = \dfrac{e}{c(e/m)_{sp}}$	$= (9.035_{10} \pm 0.010) \times 10^{-28}$g
Mass of electron (deflection)	$m_0 = \dfrac{e}{c(e/m)_{defl}}$	$= (8.994_{25} \pm 0.014) \times 10^{-28}$g
Atomic weight of electron (spectroscopic)	$m = F/(e/m)_{sp}$	$= (5.479_{22} \pm 0.003) \times 10^{-4}$
Atomic weight of electron (deflection)	$m = F/(e/m)_{defl}$	$= (5.454_{44} \pm 0.006) \times 10^{-4}$
Mass of atom of unit atomic weight	$M_0 = 1/N_0$	$= (1.6489_8 \pm 0.0016) \times 10^{-24}$g
Mass of hydrogen atom	$M_H = H/N_0$	$= (1.6617_9 \pm 0.0017) \times 10^{-24}$g
Number of atoms per gram of hydrogen	$1/M_H$	$= (6.017_{61} \pm 0.006) \times 10^{23}$ g^{-1}
Mass of proton	$M_P = (H - m)/N_0$	$= (1.6608_9 \pm 0.0017) \times 10^{-24}$g
Mass of α-particle	$M\alpha = (He - 2m)/N_0$	$= (6.597_{74} \pm 0.007) \times 10^{-24}$g
Charge (electrolysis) of 1 g hydrogen	$e/M_H = F/H$	$= (9574.5_1 \pm 0.7)$ abs-em-units · g^{-1}
Specific charge of proton	$e/M_P = F/(H - m)$	$= (9579.7_3 \pm 0.7)$ abs-em-units · g^{-1}
Specific charge of α-particle	$2e/M\alpha = 2F/(He - 2m)$	$= (4823.1_1 \pm 0.6)$ abs-em-units · g^{-1}
Ratio, mass H atom to mass electron (sp)	$(e/m)_{sp}/(e/M_H)$	$= 1839._{26} \pm 1$
Ratio, mass H atom to mass electron (defl.)	$(e/m)_{defl}/(e/M_H)$	$= 1847._{61} \pm 2$
Ratio, mass proton to mass electron (sp)	M_P/m_{sp}	$= 1839.26 - 1 = 1838._{26} \pm 1$
Ratio, mass proton to mass electron (defl.)	M_P/m_{defl}	$= 1847.61 - 1 = 1846._{61} \pm 2$
Energy associated with unit wave-number	$e/\nu' = hc$	$= (1.9627_{64} \pm 0.0025) \times 10^{-16}$ erg · cm
Potential (*es*) associated with unit frequency	$V/\nu = h/e$	$= (1.3725_4 \pm 0.0005) \times 10^{-17}$ erg . sec . es-unit^{-1}
Frequency associated with 1 abs-volt	$\nu/V'' = 10^8 e/hc$	$= (2.4302_5 \pm 0.0009) \times 10^{14}$ sec^{-1} · abs-volt^{-1}
Wave-number associated with 1 abs-volt	$\nu_0 = \nu'/V'' = 10^8 e/hc^2$	$= (8106._{31} \pm 3)$ cm^{-1} · abs-volt^{-1}
Wave-length associated with 1 abs-volt	$\lambda_0 = \lambda V'' = hc^2/e$	$= (12336._1 \pm 5) \times 10^{-8}$ cm · abs-volt
Energy of one-abs.-volt-electron	$h\nu/V'' = 10^8 e/c$	$= (1.5910_8 \pm 0.0016) \times 10^{-12}$ ergs
Speed of abs-volt-electron (sp)	$v_e = [2 \times 10^8(e/m_{sp})]^{1/2}$	$= (5.9346_4 \pm 0.0017) \times 10^7$ cm · sec^{-1}
Speed of abs-volt-electron (defl.)	$v_e = [2 \times 10^8(e/m)_{defl}]^{1/2}$	$= (5.9481_1 \pm 0.0034) \times 10^7$ cm · sec^{-1}
Fine structure constant	$\alpha = 2\pi e^2/hc$	$= (7.283_{64} \pm 0.006) \times 10^{-3}$
Reciprocal of fine structure constant	$1/\alpha$	$= 137.29_4 \pm 0.11$
Magnetic moment, Bohr magneton (sp)	$\mu_1 = \dfrac{h(e/m)_{sp}}{4\pi}$	$= (0.9174_{70} \pm 0.0013) \times 10^{-20}$ erg · gauss^{-1}

PROBABLE VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Magnetic moment, Bohr magneton (defl.)	$\mu_1 = \dfrac{h(e/m)_{defl}}{4\pi}$	$= (0.9216_{38} \pm 0.0016) \times 10^{-20}$ erg · gauss^{-1}
Magnetic moment per mole (1 Bohr magneton per molecule) (sp)	$\mu_1 N_0$	$= 5563._{87} \pm 10$ erg · gauss^{-1} · mole^{-1}
Magnetic moment per mole (1 Bohr magneton per molecule) (defl.)	$\mu_1 N_0$	$= 5589._{14} \pm 11$ erg · gauss^{-1} · mole^{-1}
Zeeman displacement per gauss	$\Delta\nu'/H = (e/m)_{sp}/4\pi c$	$= (4.674_{33} \pm 0.003) \times 10^{-5}$ cm^{-1} · gauss^{-1}
Band spectrum constant connecting cm^{-1} and moment of inertia	$h/8\pi^2 c$	$= (27.65_{83} \pm 0.04) \times 10^{-40}$ g · cm
Atomic specific heat constant	$c_2/c = h/k$	$= (4.7757_3 \pm 0.0019) \times 10^{-11}$ sec · deg.
Reduced mass of H atom	$\mu H = R_H(m_0)_{sp}/R_\infty$	$= (9.030_{19} \pm 0.010) \times 10^{-28}$ g
Schroedinger constant for H atom	$8\pi^2 \mu H/h^2$	$= (1.663_{42} \pm 0.003) \times 10^{27}$ g · erg^{-2} · sec^{-2}
Schroedinger constant for electron	$8\pi^2(m_0)_{sp}/h^2$	$= (1.664_{32} \pm 0.003) \times 10^{27}$ g · erg^{-2} · sec^{-2}
Ionization potential for H atom	R_H/ν_0	$= 13.529_9 \pm 0.005$ abs-volt
Ionization potential for He$^+$	$4R_{He}/\nu_0$	$= 54.141_7 \pm 0.020$ abs-volt
Radius of Bohr orbit in normal hydrogen, referred to center of mass, using experimental value of R_∞	$a_0' = \alpha(1-\alpha^2)^{1/2}/4\pi R_\infty$	$= (0.5281_{69} \pm 0.0004) \times 10^{-8}$ cm
Speed of electron in normal H orbit, referred to center of mass	$v_0 = \alpha c R_H/R_\infty$	$= (2.1824_2 \pm 0.0017) \times 10^8$ cm · sec^{-1}
Hydrogen doublet constant	$\Delta\nu H = R_H \alpha^2/16$	$= 0.3636_{59} \pm 0.0006$ cm^{-1}
Compton shift at 90° (sp)	$h/m_0 c = (e/m)_{sp} h/e$	$= (0.024170_4 \pm 0.000016) \times 10^{-8}$ cm
Compton shift at 90° (defl.)	$h/m_0 c = (e/m)_{defl} h/e$	$= (0.02428_{02} \pm 0.00003) \times 10^{-8}$ cm
Wave-length of 1-abs-volt-electron	$h/[m_0(v_e)_{sp}]$	$= (12.210_0 \pm 0.006) \times 10^{-8}$ cm
Loschmidt number	$n_0 = N_0/v_n$	$= (2.705_{60} \pm 0.003) \times 10^{19}$ cm^{-3} (0°C, A_n)
Wien's displacement constant (indirect)	$A = c_2/4.9651$	$= 0.28836_1 \pm 0.00011$ cm · deg
First radiation constant	$c_1 = 8\pi hc$	$= (4.932_{96} \pm 0.006) \times 10^{-15}$ erg · cm
	or hc^2	$= (0.5884_{29} \pm 0.0008) \times 10^{-5}$ erg · cm^2 · sec^{-1}
	or $2\pi hc^2$	$= (3.697_{20} \pm 0.005) \times 10^{-5}$ erg · cm^2 · sec^{-1}
Energy per mole, equivalent to 1-abs-volt-electron per molecule	$\dfrac{F(\text{abs-coul} \cdot \text{g-equiv}^{-1})}{J_{15}(\text{abs-joule} \cdot \text{cal}_{15}^{-1})}$	$= 23054._8 \pm 4$ cal$_{15}$ · mole^{-1}
Sackur-Tetrode constant (ϵ = base of ln = 2.71828)	$S_0 = R_0' \ln [(2\pi k)^{3/2}\epsilon^{5/2}/h^3 N_0^{5/2}]$	$= -11.0533 \pm 0.0026$ cal$_{15}$ · deg^{-1} · mole^{-1}
Chemical constant (unit at. wt., pressure in atm.)	$i_0' = \frac{3}{2} \log [2\pi k^{5/3}/N_0 h^2] - \log A_n$	$= -1.5882_5 \pm 0.0004$
Multiplier of (Curie constant)$^{1/2}$ to give magnetic moment in Bohr magnetons per molecule	$\dfrac{(3k/N_0)^{1/2}}{\mu_1}$	$= 2.8384_2 \pm 0.0019$ erg$^{-1/2}$ · gauss · deg$^{-1/2}$ · mole$^{1/2}$

ABBREVIATIONS AND SYMBOLS

A.	Acre
Å	Ångström unit
A	Atomic weight. Maximum work of a thermodynamic system
A_n	Normal atmosphere
A_{45}	Atmosphere, 45° latitude
a.	Acid
a	Are
(a)	Used to indicate that electrical units are based on International ohm and International ampere as defined by silver voltameter
a	Van der Waal's pressure constant. Capillary constant
abs.	Absolute
abt.	About
a. c.	Alternating current
acet.	Acetone
acet. a.	Acetic acid
al.	Alcohol
alk.	Alkali
alt.	Altitude
amal.	Amalgam. Amalgamated
amor. or amorph.	Amorphous
amp.	Ampere
anh.	Anhydrous
antilog	Antilogarithm
ap.	Apothecaries'
appr.	Approximately
aq.	Aqua. Aqueous. Water
aq. reg.	Aqua regia
asym.	Asymmetrical
atm. or atmos.	Atmosphere (atmospheric)
At. No.	Atomic number
At. Wt.	Atomic weight
aux.	Auxiliary
Av.	Average
av. or avoir.	Avoirdupois
b	Van der Waal's volume constant
bar.	Barometer
bbl.	Barrel
bd.	Board
Bé.	Beaumé (degrees)
B. G.	Birmingham gauge (hoop and sheet)
b.h.p.	Brake horse power
bl.	Blue
blk.	Black
B. M	Board measure
b. p.	Boiling point
br.	Brown
BTU	British thermal unit
bu.	Bushel
B.W.G.	Birmingham wire gauge
bz.	Benzene
C	Centigrade
C	Concentration
c	Carat. Centi-. Cold
c	Specific heat. Heat capacity of the substance. Velocity of light in vacuo.
ca	Candle
ca.	*Circa.* About. Approximately
cal.	Calorie (gram)
cc. or c.c.	Cubic centimeter
c_p, c_v	Specific heat at constant pressure, at constant volume
C_p, C_v	Molecular heat at constant pressure, at constant volume
c. cm.	Cubic centimeter
cd.	Cord
Cent.	Centigrade
centi-	Prefix meaning 1/100
cf.	*Confer*, compare

ABBREVIATIONS AND SYMBOLS (Continued)

c.f.m.	Cubic foot per minute
cgs	Centimeter - gram - second system of units
cgse	Cgs electrostatic system
cgsm	Cgs electromagnetic system
ch.	Chain
chl	Chloroform
cir.	Circular
circum.	Circumference
cl	Centiliter
cm	Centimeter
cm^2	Square centimeter
cm^3	Cubic centimeter
c. m.	Circular mil
coef.	Coefficient
colog	Cologarithm
colorl.	Colorless
comm'l.	Commercial
conc.	Concentrated
cond.	Condensing
const.	Constant
cos	Cosine
$\cos^{-1}$	Arc or angle whose cosine is. Anti-cosine of. Inverse cosine of
cosec	Cosecant
cosh	Hyperbolic cosine
$\cosh^{-1}$	Inverse hyperbolic cosine
cot	Cotangent
$\cot^{-1}$	Arc or angle whose cotangent is . . . .
coth	Hyperbolic cotangent
$\coth^{-1}$	Inverse hyperbolic cotangent
covers	Coversed sine
c. p.	Candle power. Circular pitch. Center of pressure
cry. or cryst.	Crystalline. Crystals
csc	Cosecant
$\csc^{-1}$	Arc or angle whose cosecant is
csch	Hyperbolic cosecant
csch^{-1}	Inverse hyperbolic cosecant
CTU	Centigrade thermal unit
cu.	Cubic
cu. cm	Cubic centimeter
cu. ft.	Cubic foot
cu. in.	Cubic inch
cu. m	Cubic meter
cu. yd.	Cubic yard
cwt.	Hundredweight
cyl.	Cylinder
D	Density
d	Density. Diameter. Differential; as dx; that is the differential of x.
d	Derivative. Deci-
d.	Decomposes. Dextrorotary
d_c	Critical density
$d_{t_1}^{t_2}$	Specific gravity at temperature t_2, with reference to water at temperature t_1
da	Day
d. c.	Direct current
dec.	Decomposes
deci-	Prefix meaning 1/10
def.	Definition (s)
deg	Thermometric degree, absolute C unless contrary is indicated
deka-	Prefix meaning 10
deliq.	Deliquescent
den. or dens.	Density
dg	Decigram
diam.	Diameter
dil.	Dilute

ABBREVIATIONS AND SYMBOLS (Continued)

dissd.	Dissolved
dk	Deka-
dk.	Dark
dkg	Dekagram
dkl	Dekaliter
dkm	Dekameter
dkm^2	Square dekameter
dkm^3	Cubic dekameter
dks	Dekastere
dl	Deciliter
dm	Decimeter
dm^2	Square decimeter
dm^3	Cubic decimeter
d. p.	Diametral pitch. Double pole
dr.	Dram
dr. ap. or ʒ ap.	Dram, apothecaries'
dr. av. or ʒ av.	Dram, avoirdupois
dr. fl. or ʒ fl.	Dram, fluid
dr. t. or ʒ t.	Dram, troy
ds	Decistere
dwt.	Pennyweight
E	Electromotive force. Modulus of elasticity in tension
E_0	Mean translational energy of molecule of ideal gas at 0°C
e, or ϵ	The number 2.7182818+; the base of the Napierian or natural system of logarithms. The eccentricity of a conic section
e	Electronic charge
e. g.	*Exempli gratia*. For example
efflor.	Efflorescent
e. h. p.	Effective horse power
E. L	Elastic limit
em	Cgsm unit of quantity of electricity
emf or e. m. f.	Electromotive force
equiv	Electrochemical equivalent
es	Electrostatic or Cgse unit of quantity of electricity
etc.	*Et cetera*. And so forth
eth.	Ether
eth. acet.	Ethyl acetate
et seq.	*Et sequentes*. And the following
evap.	Evaporation
ex.	Excess
exp	Exponential function
exp.	Explodes
exsec	Exterior secant
F	Fahrenheit. Faraday
f.	From
fahr.	Fahrenheit
fath.	Fathom
feath.	Feathery
f. h. p.	Friction horse power
fir.	Firkin
fl.	Fluid
fl. dr.	Dram, fluid
fl. oz.	Ounce, fluid
fluores.	Fluorescent
fps	Foot-pound-second system of units
fpse	Foot-pound-second electrostatic system
fpsm	Foot-pound-second electromagnetic system
F. S.	Factor of safety
ft.	Foot
$ft.^2$	Square foot
$ft.^3$	Cubic foot
ft.-lb.	Foot-pound

ABBREVIATIONS AND SYMBOLS (Continued)

fur.	Furlong
G	Gravitation constant
g	Gram
g	Acceleration due to gravity
g_n	Acceleration of gravity (normal)
g_s	Standard gravity, 980.665 centimeters per second squared
g_{45}	Acceleration of gravity at latitude (45°)
gal.	Gallon
g-cal or g.-cal.	Gram-calorie
gel.	Gelatinous
gi.	Gill
glac.	Glacial
glit.	Glittering
glyc.	Glycerine
gm.	Gram
gr.	Grain
gr.	Gray
grn.	Green
gyr.	Gyration
h	Hecto-
h.	Hot
hecto-	Prefix meaning 100
h	Height. Hour
h	Planck's constant of action
ha	Hectare
hex.	Hexagonal
hg	Hectogram
hhd.	Hogshead
hl	Hectoliter
hm	Hectometer
hm^2	Square hectometer
hm^3	Cubic hectometer
hor. or horiz.	Horizontal
h.-p.	High-Pressure
HP or h. p.	Horse power
h. p.-hr	Horse power-hour
hr.	Hour
hyg.	Hygroscopic
I	Electric current
i.	Insoluble
ibid.	*Ibidem.* In the same place
i. e.	*Id est.* That is
ign.	Ignites
i. h. p	Indicated horse power
in.	Inch
$in.^2$	Square inch
$in.^3$	Cubic inch
in.	Indigo
inc.	Inclusive
in.-lb.	Inch-pound
insol.	Insoluble
Int.	International
iso.	Isotropic
isom.	Isometric
isoth.	Isothermal
J	Radiation. Mechanical equivalent of heat
J_λ	Intensity of monochromatic radiation of wave-length λ
j	Imaginary quantity $(\sqrt{-1})$
K	Karat. Kelvin, or absolute C scale of temperature
K	Constant of chemical equilibrium
k	Kilo-
k	Velocity coefficient chemical reaction
k_o	Boltzmann's gas constant
kg	Kilogram
kg-cal.	Kilogram-calorie
kg-m	Kilogram-meter
kilo-	Prefix meaning 1,000
kl	Kiloliter
km	Kilometer
km^2	Square kilometer
km^3	Cubic kilometer
kva.	Kilovolt-ampere

ABBREVIATIONS AND SYMBOLS (Continued)

kw.	Kilowatts
kw.-hr.	Kilowatt-hour
l.	Laevo-rotary. Long
l	Liter
l	Length
lat	Latitude
lb.	Pound
lb. ap.	Pound, apothecaries'
lb. av.	Pound, avoirdupois
lb. t.	Pound, troy
leaf.	Leaflets
lgr.	Ligroin
li.	Link
lim.	Limit
lin.	Linear
liq.	Liquid
ln	Natural Hyperbolic or Napierian logarithm
lng.	Long
log or log.	Logarithm
$\log_e$	Logarithm to the base *e*; natural, hyperbolic or Napierian logarithm
$\log_{10}$	Common logarithm. Logarithm to the base 10
long.	Longitude
l.-p.	low-pressure
lt.	Light
lust.	Lustrous
M.	The modulus of a system of logarithms; used especially for the modulus of the common system of logarithms, the base of which is 10. In this system it is equal to 0.4342944819+
M	Molecular weight
$M[\alpha]$	Molecular rotatory power
$M[\omega]$	Molecular magnetic rotatory power
♍	Minim or drop
m	Meter. Milli-
m	Mass. Minute
m.	Meta-
m^2	Square meter
m^3	Cubic meter
$m\mu$	Millimicron. Millimicro-
m_0	Mass of electron at low velocity
m_H	Mass of a hydrogen atom
max.	Maximum
med.	Medium
meth.	Methyl
meth. al.	Methyl alcohol
m. e. p.	Mean effective pressure
met.	Metallic
mg	Milligram
m.h.c.p.	Mean horizontal candle power
mi.	Mile
mic.	Microscopic
micro-	Prefix meaning 1/1,000,000 or 10^{-6}
micro-micro-	Prefix meaning 10^{-12}
milli-	Prefix meaning 1/1,000
milli-micro-	Prefix meaning 10^{-9}
min	Minute
min.	Minim. Minimum. Mineral
ml	Milliliter
m.l.h. c.p.	Mean lower hemispherical candle power
mm	Millimeter
mm^2	Square millimeter

ABBREVIATIONS AND SYMBOLS (Continued)

mm^3	Cubic millimeter
mmf or m.m.f.	Magnetomotive force
mol.	Molecule
Mol. Wt.	Molecular weight
monocl.	Monoclinic
m. p.	Melting point
m.s.c.p.	Mean spherical candle power
myria-	Prefix meaning 10,000 or 10^4
N	Numeric. Number (in mathematical tables)
N_o	Avogadro's number
N_∞	Rydberg's universal series constant
n	Refractive index
n.	Normal
n_o	Loschmidt's number
need.	Needles
n_a, n_k	Transport number for anion, kation
O	Atomic weight of oxygen
o	Ortho-
Obs.	Observer
octahdr.	Octahedral
oil turp.	Oil of turpentine
or.	Orange
oz.	Ounce
oz. ap. or ℥ ap.	Ounce, apothecaries'
oz. av. or ℥ av.	Ounce, avoirdupois
oz. fl. or ℥ fl.	Ounce, fluid
oz. t. or ℥ t.	Ounce, troy
P or p	Pressure
p	Para-
pa.	Pale
p. ct.	Per cent
perp.	Perpendicular
p. f.	Power factor
pk.	Peck
pl.	Plates
powd.	Powder
p_c, p_r	Critical pressure, reduced pressure
pr.	Prisms
precip. or p'p't'd.	Precipitated
p. sol.	Partly soluble
pt.	Point. Pint
purp.	Purple
pyr.	Pyridine
Q	Quantity
q	Quintal
qt.	Quart
q. v.	*Quod vide*. Which see
R	Réaumur. Radioactive mineral
R	Volume of perfect gas (O °C, A_{45}) Gas constant per mole of ideal gas. Electrical resistance.
r	Radius
r_G	Specific refractivity (Gladstone and Dale)
r_L	Specific refraction (Lorentz and Lorenz)
rac.	Racemic
rad	Radian measure of angle
rad.	Radius
rd.	Rod
reg.	Regular
rev.	Revolution
rhbdr.	Rhombohedral
rhomb.	Rhombic or orthorhombic
R.M.S.	Square root of mean square
r.p.m.	Revolutions per minute
S	Entropy
s	Stere

ABBREVIATIONS AND SYMBOLS (Continued)

s.	Scruple. Soluble
s. ap. or ℈.	Scruple, apothecaries'
s	Second
sat. or sat'd.	Saturated
sc.	Scales
S. E.	Siemens unit
sec or sec.	Second (mean solar unless contrary is stated)
sec	Secant
sec^{-1}	Arc or angle whose secant is . . . . .
sech	Hyperbolic secant
$sech^{-1}$	Inverse hyperbolic secant
segm.	Segment
sh.	Short
sin	Sine
sin^{-1}	Arc or angle whose sine is . . . .
sinh	Hyperbolic sine
$sinh^{-1}$	Inverse hyperbolic sine
sl.	Slightly
sl. sol.	Slightly soluble
sm.	Small
sol.	Solution. Soluble
soln.	Solution
sp.	Specific
specif.	Specification
sp. gr.	Specific gravity
sq.	Square
sq. ch.	Square chain
sq. ft.	Square foot
sq. in.	Square inch
sq. mi.	Square mile
sq. rd.	Square rod
sq. yd.	Square yard
std.	Standard
subl.	Sublimes
sym.	Symmetrical
T	Temperature on absolute C scale
T_c	Critical temperature absolute C
t_c	Critical temperature C (above ice point)
t	Metric ton
t.	Troy
t	Time. Temperature C (above ice point)
tab. or tabl.	Tablets
tan	Tangent
tan^{-1}	Arc or angle whose tangent is . . . .
tanh	Hyperbolic tangent
$tanh^{-1}$	Inverse hyperbolic tangent
temp.	Temperature
tetr. or tetrag.	Tetragonal
tn.	Ton
tr.	Transition
tricl.	Triclinic
trig.	Trigonal
trim.	Trimetric
T. S.	Tensile strength
Tw.°	Degrees Twaddell, hydrometer scale
ult.	Ultimate
uns.	Unsymmetrical
U. S.	United States of America. Universal system of lens apertures
V or v	Volume
v.	*Vide.* See
(v)	Indicating electrical units based on International ohm and International volt as defined by standard cell
v.	Very
V_n	Volume of perfect gas (0 °C, A_n)

ABBREVIATIONS AND SYMBOLS (Continued)

v_0	Volume per gram-mole of ideal gas at 0 °C and A_n
vel. or veloc.	Velocity
vers	Versed sine
vert	Vertical
visc.	Viscous
vol.	Volume
volt.	Volatilizes
v_c, v_r	Critical volume, reduced volume
W	Electrical resistance
w	Water
w	Wien's displacement constant
wh.	White
wt.	Weight
$\lvert x \rvert$	Absolute value of x
yd.	Yard
yel.	Yellow
yr.	Year
Z	Atomic number

α (Alpha)	Degree of dissociation. Angle of optical rotation
$[\alpha]$	Specific rotatory power
β (Beta)	Specific heat constant
γ (Gamma)	Surface tension. Ratio of c_p/c_v. Gamma magnetic units
Δ (Delta)	Diffusion coefficient. Finite difference
Δx	Increment of x
δ (Delta)	Variation; as, δx; that is, the variation of x.
ϵ (Epsilon)	Dielectric constant. Electrode potential. Base of natural logarithms.
ϵ_h, ϵ_c	Electrode potential above that of normal hydrogen. of normal calomel, electrode
η (Eta)	Viscosity
θ (Theta)	Angle (plane). Angular displacement. Temperature C above ice point.
κ (Kappa)	Susceptibility (magnetic). Electrical (volume) conductivity
Λ Lambda)	Equivalent conductivity (electrical)
λ (Lambda)	Wave-length. λ 5890 = spectral line of wave-length = 5890Å
λ_m	Wave-length of maximum monochromatic radiance of black-body at stated temperature
μ (Mu)	Permeability (magnetic). Micron, Micro-, Molecular conductivity (electrical)
$\mu\mu$	Micromicron. Micromicro-
ν (Nu)	Frequency
ν_∞	Rydberg's fundamental frequency

π (Pi)..........The number 3.14159265+; the ratio of the circumference of a circle to its diameter, of a semicircle to its radius, and of the area of a circle to the square of its radius.

Σ (Sigma)......Summation of—commonly used to indicate the sum or summation of finite differences, and nearly like $\int$.

σ (Sigma)......Stefan-Boltzmann constant

φ ....Fluidity. Angle

Ψ (Psi).........Luminous flux

Ω (Omega).....Ohm

[Ω]............Relative molecular magnetic rotatory power with reference to water

ω (Omega).....Solid angle. Angular velocity

[ω]............Specific magnetic rotatory power

$+$ ....Plus (sign of addition). Positive

$-$ ....Minus (sign of subtraction). Negative

$\pm$, ($\mp$)..........Plus or minus (Minus or plus) Positive or negative (Negative or positive)

$\times$ or $\cdot$ ....Multiplied by. Sign of multiplication

$\cdot$ ....Multiplied by

$\div$ or : ....Divided by

/ ....Divided by

= or : : ....Equals, is equal to, as

: Is to; the ratio of
: : As; equals;

Used to indicate geometrical proportion; as, $a{:}b \; :: \; c{:}d$; a is to b as c is to d; or; the ratio of a to b equals the ratio of c to d.

$\doteq$..............Is approximately equal to

$>$ ....Greater than. Above

$<$ ....Less than. Below

$\gtreqless$, ($\geqq$)........Equal to or greater than, (greater than or equal to)

$\lesseqgtr$, ($\leqq$)........Equal to or less than, (less than or equal to)

$\nless$..............Negative of $<$; $a \nless b$ denotes that a is not less than b

$\ngtr$ ....Is not greater than; $a \ngtr b$; a is not greater than b

$\ddagger$..............Is not equal to

$\neq$..............Is not equal to

$\rightarrow$ or $\doteq$ ....Approaches

$\triangleq$..............Denoting equivalence in area or volume (In geometry)

$\cong$	Approximately equal to
$\approx$	Approximately equal to
$\sim$	The difference between;—denoting a difference between two quantities without designating the greater; as, $a \sim b$
$\propto$	Varies as; is proportional to
∞	Infinity. Indefinitely great. Infinite. Soluble in all proportions
! or $\llcorner$	The continued product of numbers from one upward; the factorial; as $4! = \underline{\lvert 4} = 1 \times 2 \times 3 \times 4$
$\therefore$	Therefore. Hence. On this account
$\because$	Because. Since
....	And so on
$\equiv$	Is identical with. Is congruent with.
$\multimap$	Is a part of
$\underset{\cdot}{\sim}$ or $\backsim$	Is similar to
%	Per cent. Per Hundred
‰	Per thousand or 0.1%
$\angle$	Angle
$\llcorner$	Right angle
$\perp$	Perpendicular to
$\parallel$	Parallel to
$\bigcirc$	Circle; Circumference; 360°
$\frown$	Arc of a circle. Arc
$\triangle$	Triangle
$\square$	Square
▭	Rectangle
$\sqrt{\ }$	Square root
$\sqrt[n]{\ }$	nth root
a^n	nth power of a
$a^{\frac{1}{n}}$	The nth root of a. The root of a quantity is denoted by a fractional index at the right hand side of the quantity and above it, the denominator of the index expressing the degree of the root; as, $a^{\frac{1}{2}}$, $a^{\frac{1}{3}}$, $a^{\frac{1}{5}}$; that is, the square, cube, and fifth roots of a, respectively
( ) [ ] { }	Parentheses, brackets and braces. Quantities enclosed by them to be taken together in multiplying, dividing, etc.
$\overline{AB}$	Length of line from A to B
$f(x)$, $F(x)$ or $\phi(x)$	Functions of x

dx . . . . Differential of x

$\frac{dy}{dx}$ or $f'(x)$ . . . . . . Derivative of $y = f(x)$ with respect to x

$\frac{d^2y}{dx^2}$ or $f''(x)$ . . . Second derivative of $y = f(x)$ with respect to x

$\frac{\partial z}{\partial x}$ . . . . Partial derivative of z with respect to x

$\frac{\partial^2 z}{\partial x\,\partial y}$ . . . . Second partial derivative of z with respect to y and z

$\int$ . . . . Integral; integral of;—denoting that the following expression is to be integrated; as $\int 2xdx = x^2$; that is the integral of $2xdx$ is x^2. If integration is to be performed more than once for each time; for a number of times greater than 3, and index is commonly written at the right hand above; as $\int^m xdx^m$ that is, the mth integral of xdx^m.

$\int_b^a$ . . . . Denotes that the integral is to be taken between the value b of the variable and its value a.

II . . . . Product; the continued product of all terms such as . . . .

($\wr$) . . . . A symbol for a quantic which has no numerical coefficients; as, $(a,b,c,d,\wr\, x,y)$ which denotes the quantic $ax^3+bx^2y+cxy^2+dy^3$

° . . . . Degree (arc or temperature)

′ . . . . Minute of arc (sexagesimal). Foot.

″ . . . . Second of arc (sexagesimal). Inch.

a^1, a^2, a^3 . . . . Indices placed above and at the right hand of quantities to denote that they are raised to powers whose degree is indicated by the figure; as, a^1; that is, the first power of a; a^2, the square, or second power, of a; a^3, the cube, or third power of a; and the like. These signs are also often used to indicate the repetition of an operation; as, d^2x, d^3x, d^4x, etc., indicating that the operation of differentiation has been performed upon x two, three, four, etc., times. As used to indicate powers, they are often preceded by the negative sign to indicate the reciprocal of the corresponding power, or an inverse operation; as, a^{-1}, a^{-2}, a^{-3}, a^{-4}, etc., which are respectively equivalent to $\frac{1}{a^1}, \frac{1}{a^2}, \frac{1}{a^3}, \frac{1}{a^4}$, etc.

Q

R

T

No. 164 APRONS—Black Rubber. Heavier than No. 160. Our most popular number. Excellent for general use. **Grade 1230.**
Per Dozen **7.80**

No. 168 APRONS—White Rubber. Used wherever extreme cleanliness and neatness are required. **Grade 1260.**
Per Dozen **8.40**

No. 172 APRONS—Red Rubber. An unusually serviceable apron. **Grade 1215.**
Per Dozen **8.40**

No. 176 APRONS—Heavy Black Rubber. Will withstand the hardest usage. **Grade 1000.**
Per Dozen **18.00**

Rubber Laboratory Sleeves

Sleeves, to match Nos. 140-146 Aprons, are long and roomy. They are made with elastic ends which insure a snug fit and yet allow them to be easily and quickly removed.

No. 161 SLEEVES—Grade 1290. Per Dozen **1.80**

No. 165 SLEEVES—Grade 1230. Also recommended for use with Aprons—**Grade 1000. Per Dozen** **1.80**

No. 169 SLEEVES—Grade 1260. Per Dozen **1.80**

No. 173 SLEEVES—Grade 1215. Per Dozen **1.80**

Rubber Tubing

Tubing designed for ordinary purposes will not serve the requirements of the laboratory. The following grades of tubing, made according to our own specifications are noted for their long wearing qualities, flexibility, and elasticity.

Grade 9910 RUBBER TUBING—White Wrapped Light Wall, carefully made of the best materials and finished in a superior manner. For general laboratory use.

Inside diam. in.	1/8	3/16	1/4	5/16	3/8
Wall, in.	1/32	3/64	1/16	5/64	3/32
Approx. ft. per lb.	65	35	24	14	10
Price per lb.	4.00	1.75	1.05	1.00	.80

Inside diam. in.	1/2	5/8	3/4	1
Wall, in.	1/8	1/8	9/64	5/32
Approx. ft. per lb.	5	4	3	2
Price per lb.	.80	.80	.80	.80

Grade 9912 RUBBER TUBING—White Wrapped Pressure Tubing, Heavy Wall, of the same composition as Grade 423. Recommended especially for burner connections.

Inside diam. in.	1/8	3/16	1/4
Wall, in.	5/64	3/32	7/64
Approx. ft. per lb.	32	16	11
Price per lb.	1.20	1.00	.80

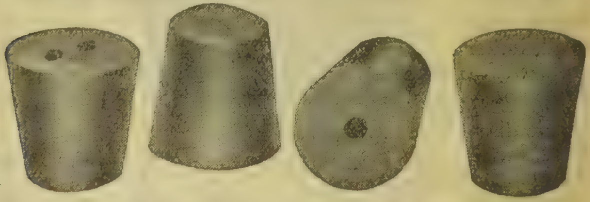
Inside diam. in.	5/16	3/8
Wall, in.	1/8	1/8
Approx. ft. per lb.	8	7
Price per lb.	.80	.80

Grade 9914 RUBBER TUBING—Pure Gum Red Antimony, of the finest selected crude rubber treated by the most improved methods.

Inside diam. in.	$\frac{1}{8}$	$\frac{3}{16}$	$\frac{1}{4}$
Wall, in.	$\frac{1}{32}$	$\frac{3}{64}$	$\frac{1}{16}$
Approx. ft. per lb.	96	48	30
Price per lb.	4.80	2.40	1.45
Inside diam. in.	$\frac{5}{16}$	$\frac{3}{8}$	$\frac{1}{2}$
Wall, in.	$\frac{5}{64}$	$\frac{3}{32}$	$\frac{7}{64}$
Approx. ft. per lb.	20	10	8
Price per lb.	1.20	1.00	1.00

Grade 9920 RUBBER TUBING—Black Pure Gum. The best for general laboratory use.

Inside diam. in.	$\frac{1}{8}$	$\frac{5}{32}$	$\frac{3}{16}$	$\frac{1}{4}$	$\frac{5}{16}$
Wall, in.	$\frac{1}{32}$	$\frac{3}{64}$	$\frac{3}{64}$	$\frac{1}{16}$	$\frac{5}{64}$
Approx. ft. per lb.	130	70	57	40	25
Price per lb.	5.60	4.00	3.50	2.50	2.00
Inside diam. in.	$\frac{3}{8}$	$\frac{1}{2}$	$\frac{5}{8}$	$\frac{3}{4}$	1
Wall, in.	$\frac{3}{32}$	$\frac{7}{64}$	$\frac{1}{8}$	$\frac{9}{64}$	$\frac{5}{32}$
Approx. ft. per lb.	18	11	8	6	5
Price per lb.	1.75	1.50	1.50	1.50	1.50



Pure Crepe Gum Rubber Stoppers

These rubbers stoppers are made from Pure Crepe Gum; full floating stock, non-blooming, and heat resisting. Have a specific gravity of .9718. Do not contain any fillers or adulterants. Based on longer life, freedom from hardening, better fit to the outlet and infrequent replacement, they represent a marked advance in the manufacture of Rubber Stoppers. A bomb test equivalent to five years exposure to atmospheric conditions, shows little or no change in quality. Manufactured in sizes 00 to 13. Compared to ordinary stoppers, you receive approximately 25% more to the pound. Upon request we will send you a table showing a complete range of sizes and the number of rubber stoppers you receive per pound, as compared to the ordinary stopper. Sample will be gladly furnished gratis.

Price — $1.00 per lb.
